Executive Summary

Baffinland Iron Mines Corporation (Baffinland) owns and operates an open pit iron ore mine (the Project) located in the Qikiqtani Region of North Baffin Island, Nunavut, in accordance with Terms and Conditions of its Project Certificate (PC) No. 005. Ore is transported to market during the open water season by chartered vessels that receive the ore in Milne Port, located at the head of Milne Inlet at the western end of Eclipse Sound. Shipping commenced in 2015 and is expected to continue for the life of the Project (20+ years).

As a part of regulatory commitments, Baffinland has developed and implemented a multi-disciplinary Marine Environmental Effects Monitoring Program (MEEMP). The MEEMP is designed to evaluate potential Project-related effects on the marine environment as predicted in the Final Environmental Impact Statement (FEIS) and FEIS addenda (Baffinland 2012, 2013). The MEEMP includes monitoring of marine water and sediment quality, marine benthic invertebrates, marine vegetation, and fish and fish habitat. The sampling design is generally based on the Metal Mining Environmental Effects Monitoring (EEM) technical guidelines (Environment Canada 2012) and includes statistical approaches for detecting potential Project-induced impacts on the marine environment. Nonindigenous Species/Aquatic Invasive Species (NIS/AIS) monitoring is an integral component of the MEEMP and is designed to address the potential risks of species introductions to the marine environment from ship ballast water and hull biofouling.

This report presents the results of the MEEMP and NIS/AIS monitoring programs conducted in Milne Inlet during the 2023 open-water season, the ninth consecutive year of monitoring.

MARINE WATER QUALITY (CHAPTER 2.0)

The marine water quality component of the MEEMP involves monitoring of water quality in the Milne Inlet receiving environment to confirm that site discharges are in compliance with requirements outlined in the Type A Water License and satisfy Project Certificate (PC) Conditions No. 76, 83(a), 87, 89 and 99(a). Water quality samples are collected at four sampling stations in Milne Inlet downstream from the primary discharge point (MP-05), as well as four sampling stations downstream from a second discharge point (MP-06) at Milne Port. These receiving environment stations are distributed in a radial design up to approximately 250 m from each discharge point to monitor for potential changes in water quality due to site drainage and operational discharges, including iron ore stockpile run-off.

In 2023, reported analytical results for water quality parameters (i.e., major ions, nutrients, metals, hydrocarbons, and polycyclic aromatic hydrocarbons [PAHs]) were generally within ranges observed during previous MEEMP sampling programs (2015 to 2022). Consistent with previous programs, hydrocarbons and PAHs were not detected in the 2023 water samples. In fact, a substantial proportion of parameters analyzed in the water samples from Milne Inlet were not detected at all in downstream sampling stations. All parameters were below relevant water quality guidelines (i.e., Canadian Council of Ministers of the Environment Water Quality Guidelines; CCME WQGs).

Collectively, measured concentrations of metals, nutrients, hydrocarbons were either not detected or were present at low concentrations, such that adverse impacts to the biota in the Milne Inlet receiving environment are unlikely to occur. Increased iron deposition in the marine environment as a result of Project activities is a primary interest for local Inuit. Given that CCME marine WQGs for iron have not been developed, 2023 data were compared to iron data collected during previous MEEMP programs (2017 to 2022) to evaluate whether increases in production at Milne Port have led to associated increases in iron concentrations. Total iron concentrations in marine water samples collected in 2023 were below the concentrations measured in previous years in the receiving environments of the MP-05 and MP-06 site discharges. Dissolved iron concentrations were below detection limits in each of the samples collected in 2023, meaning the majority of detectable iron concentrations were driven by the particulate form and less bioavailable for uptake by aquatic biota. Results of the trend analysis indicated that 2023 MP-06 total iron concentrations were statistically lower than previous sampling years, with effect sizes ranging from -83% (comparison between 2023 and 2022 for ENE station) and -3% (comparison between 2023 and 2021 for Source station). The 2023 MP-05 concentrations were lower in 2023 than measured in 2022, however statistical significance was not seen in the trend analysis.

Total copper had higher variability observed in 2022 relative to previous years. The observed variability in total copper did not appear to be an issue in the 2023 sampling program, with average concentrations roughly 3-times lower than those observed in 2022; further, dissolved copper concentrations were below detection limits in 24 of the 40 samples collected.

Overall, results indicate that, to date, water discharged from site into the marine receiving environment meets the requirements of the Type A Water License and that water quality parameter concentrations remain below thresholds of harm for marine biota. Moving forward, continued compliance monitoring for water quality is recommended.

MARINE SEDIMENT QUALITY (CHAPTER 3.0)

To satisfy PC Conditions No. 83(a) and 99(a), sediment samples were collected along four transects, including three transects (West, East, and Northwest) surveyed from 2014 to 2018, and an additional transect, the Northeast transect, which was added in 2019 to account for potential future changes to Milne Port infrastructure. The radial gradient sampling design enables effects to be monitored as a function of distance from the Ore Dock (potential point source), in consideration of potential contaminant sources (e.g., ore dust, hydrocarbon deposition) and/or physical impacts (sediment re-suspension and transportation) in the marine environment.

In 2023, analyses of the physical and chemical composition of sediments were conducted on samples collected from a total of 45 stations for particle size, metals, and organic parameters. In general, concentrations of metals were determined to be less than applicable sediment quality guidelines, with few exceptions. Concentrations of organic parameters were largely not detected in the sediments sampled. Statistical spatial and temporal trend analyses did not suggest that sediment metal concentrations were accumulating at elevated levels in proximity to the Ore Dock relative to other locations sampled within Milne Inlet.

Some minor exceedances of Interim Sediment Quality Guidelines (ISQGs) were noted for arsenic, nickel, and copper but are not considered to be Project-related, as these metals are not associated with ore processing at Mary River and tended to increase with greater distance away from the Ore Dock. The low magnitude of exceedances in some samples are most likely reflective of background conditions and related to physical sediment properties (i.e., percent fines), rather than Project activities. As demonstrated through statistical

analyses, distribution of fine sediment (which is strongly related to sediment metals) in Milne Inlet is largely not influenced by Project activities but, rather by natural coastal processes that differed between the Northern Offshore Transects and the Coastal Transects. The exception is the finding of likely localized scouring effects (associated with propeller wash) in the immediate vicinity of the Ore Dock area on the coastal West Transect, as predicted in the Final Environmental Impact Statement (FEIS). These effects are expected to stabilize over time. Importantly, associated impairment of the benthic community was only documented in 2020 at one station (SW-2) in this area, with both density and richness continuing to rebound in 2023.

As observed for the fines content of the sediments, while the 2023 MEEMP found that spatial trends in the sediment iron continued to differ between the four monitored transects, more subtle temporal trends or a lack of trends were evident over time. Results found that in general the iron content of sediments sampled from Milne Inlet in 2023 was not significantly greater than that measured under baseline conditions, thus, indicating sediment iron concentrations have not increased over time in the Milne Inlet study area. Similar to other metals, iron was not present in elevated concentrations close to the Ore Dock area, and concentrations up to 250 m from the Ore Dock area were either stable or exhibited a decrease over time.

Sediment monitoring to date suggests that mitigation measures are functioning as intended and that Project activities are being managed in a way that has not adversely affected marine sediment within the Milne Inlet study area. Given that there will be continued use of larger ore carriers (Baby Cape and Capesize) at Milne Port, Baffinland has committed to a frequency of annual sampling of the eight Capesize monitoring stations for a minimum of three years (2023 to 2025) to identify Project-related effects due to the change in vessel types.

Overall, results indicate that, to date, marine sediment quality results remain within FEIS predictions and subsequent addenda, which forecasted no significant residual effects on sediment quality but indicated the potential for minor localized sediment disturbance associated with propeller wash, which is expected to stabilize over time.

BENTHIC INFAUNA (CHAPTER 4.0)

To satisfy PC Conditions No. 99(a) and 99(c), the 2023 benthic infauna component involved the collection of benthic infauna samples (co-located with sediment stations) along two Coastal Transects (East and West) and two Northern Offshore Transects (Northeast and Northwest) according to a radial study design. The radial gradient sampling design enables effects to be monitored as a function of distance from the Ore Dock (potential point source), in consideration of potential contaminant issues (e.g., ore dust, hydrocarbon deposition) and/or physical impacts (sediment re-suspension and transportation) in the marine environment. Additionally, three new benthic infauna stations (SE18-1, SCV-1, and SCV-2) were included in the 2023 program for developing an existing conditions characterization of stations for the Capesize vessel sampling program to identify Project-related effects due to the use of larger ore vessels (Baby Cape and Capesize) at Milne Port in accordance with Project Term and Condition 83(a). Eight stations in total comprise the stations to be monitored for the effects of larger ore carriers (stations SW-1 through SW-4, SE18-1, SNW-1, SCV-1 and SCV-2). Samples were collected as a composite of three Van Veen sediment grabs from each station, processed in the field, and preserved for laboratory analysis. Infaunal organisms were subsequently identified to the lowest practical taxonomic level and enumerated by experienced marine benthic taxonomists at Biologica Environmental Services Ltd. (taxonomic laboratory).

As observed in previous years, benthic infauna communities in Milne Inlet were mainly dominated by polychaetes. Malacostraca crustaceans were somewhat co-dominant with polychaetes along the Coastal East Transect, whereas further offshore in deeper waters, polychaetes occasionally co-existed with Malacostraca crustaceans, bivalves, and ostracods. Statistical analysis was focused on four key benthic infauna endpoints – invertebrate density, richness, diversity, and evenness – consistent with previous MEEMP years. Analysis of the data revealed spatial variability in community endpoints, particularly between nearshore and offshore environments, which is expected given that density and biomass of marine benthic infauna tends to decrease with increasing water depth and distance from land. Spatial variability within the Coastal Transects was also observed, attributed to the coastal topography and processes, such as freshwater input from Phillips Creek. Invertebrate densities were either higher in 2023, or were not significantly lower relative to 2018, 2019, or 2020. Densities were not monitored in 2021 and 2022 as, following the 2020 sampling year, the radial sampling design is sampled every three years.

Benthic infaunal communities in 2023 were diverse throughout the study area. There were no consistent differences between years (2023 vs 2018, 2019, and 2020) in benthic community indicators along the four transects and, in isolated instances where indicators were significantly different between years, endpoints tended to be different only when comparing 2023 to 2019. Statistical differences also tended to occur at greater distances from the Ore Dock compared to closer to the dock. These results do not align with the community response pattern typical of a toxicological impairment due to contaminant exposure, which manifests as a significant decrease in both density and richness as contaminant-sensitive taxa disappear or numbers are diminished, leaving more tolerant taxa to dominate the community. Rather, the 2023 results are more consistent with expected natural variability for these benthic habitat types within Milne Inlet, as there appears to be no evidence to suggest impairment of benthic communities related to the Project.

Monitoring results for 2023 remained within original FEIS predictions, which forecasted no significant adverse residual effects to Arctic char habitat. The 2023 results, in combination with those from sediment monitoring to date, suggest that mitigation measures are functioning as intended and that Project activities are being managed in a way that has not had adverse, lasting effects on benthic infaunal communities in the study area. Given that there will be continued use of larger ore carriers (Baby Cape and Capesize) at Milne Port, Baffinland has committed to a frequency of annual sampling of the eight Capesize monitoring stations, for a minimum of three years to identify Project-related effects due to the increased vessel traffic.

Overall, results to date indicate that construction and operational activities at Milne Port do not appear to have resulted in adverse effects on benthic infauna in the marine receiving environment. Existing benthic infaunal communities continue to be diverse and well established in both nearshore and offshore habitats.

SUBSTRATE, MACROFLORA, AND BENTHIC EPIFAUNA (CHAPTER 5.0)

Sampling of substrate, macroflora, and benthic epifauna fulfills PC Condition No. 99(a) and (c) and is relevant to PC Conditions No. 76, 83(a), 84 and 87. To evaluate potential project-related effects on substrate, macroflora, and benthic epifauna, standardized underwater visual census methods were employed by SCUBA-based scientific divers to survey algae, invertebrate, and fish species and to record habitat type within a series of survey quadrats permanently installed on the seafloor in both an exposure area (Milne Port) and a reference area. Specimens were opportunistically collected and sent to an accredited taxonomy laboratory (Biologica Environmental Services Ltd.) for taxonomic identification. Indicators included percent cover (%) of substrate type, benthic macroflora, and sessile benthic epifauna, density (counts) for motile epifauna, and diversity indices (i.e., taxa richness and Simpson's Diversity Index [SDI]) for macroflora and epifauna.

Quadrat sampling in 2023 indicated the benthic environment of Milne Port and the reference area mainly consisted of soft substrate, primarily silt and sand. Interannual differences were observed in the proportion of the bottom covered by soft substrate, with lower mean soft substrate in 2022 compared to 2021 and 2023. Similar macroflora and epifaunal taxa were observed in 2023 as in previous years (2021-2022). Community indicators (i.e., percent cover, density, taxa richness, and SDI) were variable among quadrats, but were not significantly different between Milne Port and reference area in 2023 except for macroalgae taxa richness, which was lower in Milne Port compared to the reference area. Additionally, macroalgae percent cover differed significantly only within the reference area among sampling years, with mean macroalgae percent cover highest in 2021. Motile epifauna density significantly differed among years within each area, with density significantly higher in 2023 than in 2021 in Milne Port and density significantly higher in 2022 than in 2021 and 2023 in the reference area. Interannual differences were observed in macroalgae taxa richness in the reference area (lower in 2023 than in 2022) and SDI in Milne Port (lower in 2023 than in 2021 and 2022).

As was done in previous years, effect size was explored using a power analysis simulation to detect Project-related change based on levels of observed variability among quadrats. The power analysis found sufficient power to detect large changes in soft substrate, epifauna and macroflora. Given the low statistical power to detect effect sizes that may be of biological relevance, going forward, it is recommended that conclusions are not made based on strict adherence to statistical significance. Instead, effect size, uncertainty, and statistical significance and power should be considered together before ruling out spatial and temporal changes in benthic infauna.

Overall, macrofloral and benthic epifaunal community assemblages were comparable between exposure and reference areas. Interannual variations in some indicators were likely driven by regional environmental factors. Monitoring efforts to date revealed no evidence of overarching spatial or temporal trends that might be associated with Project-induced effects from construction or operation activities. Monitoring of macroflora and benthic epifauna assemblages is recommended to continue, using the same sampling and statistical design. Further, it is recommended to increase collections of unknown taxa, when possible, for analyses and identification. Where possible, such taxa should be collected outside the permanent quadrats to minimize impacts on community composition within the quadrats.

Overall, while noting the statistical limitations of this component (i.e., high variability leading to generally low statistical power), the 2023 survey results indicated that Project activities to date have not resulted in adverse effects on macrofloral and epifaunal communities in Milne Port.

MARINE FISH COMMUNITY (CHAPTER 6.0)

To satisfy PC Conditions No. 99(b)(ii), 99(c), 113, and 114, sampling was conducted to assess the relative abundance of Arctic char (*Salvelinus alpinus*) and other fish species in the Milne Port area. Multiple sampling methodologies (e.g., gill nets, angling-jigging, angling-trolling, hoop nets, Fukui traps, and trawling) were used to target different fish species and habitat types. Collected fish were identified to the lowest practicable taxonomic level, typically to species level, before being released. Fish not identified to species level in the field were retained for subsequent identification by an accredited taxonomic laboratory. Fish community composition (diversity), abundance, and catch per unit effort (CPUE) were compared among years and CPUE was compared between two fishing areas (FAs) defined for the port: Direct Project Footprint (DPF) and Indirect Project Footprint (IPF), delineated by habitat features and their proximity to existing port infrastructure and operational activities.

A total of 422 fish belonging to 12 known taxa were recorded in Milne Port from 82 fishing events (efforts) using a combination of methods during the 2023 open water survey season. Similar to previous sampling years, Arctic Char (*Salvelinus alpinus*), Fourhorn Sculpin (*Myoxocephalus quadricornis*) and Shorthorn Sculpin (*Myoxocephalus scorpius*) were the most abundant species. Other fish captured were Arctic Staghorn Sculpin (*Gymnocanthus tricuspis*), Ribbed Sculpin (*Triglops pingelii*), Pacific Cod (*Gadus macrocephalus*; formerly *G. ogac,* which is no longer considered an accepted species), Arctic Alligatorfish (*Aspidophoroides olrikii*), Arctic Sculpin (*Myoxocephalus scorpioides*), Spatulate Sculpin (*Icelus spatulata*), and single instances of a juvenile Polar Cod (*Boreogadus saida*), a Saddled Eelpout (*Lycodes mucosus*), an Atlantic Spiny Lumpsucker (*Eumicrotremus spinosus*), and an unidentified juvenile cod (*Gadus* sp.). This was the first record of Atlantic Spiny Lumpsucker as a capture of the fish community monitoring program, but this species was previously observed during visual monitoring of Milne Port and is not considered to be a non-indigenous species.

The composition and abundance of the fish community captured in 2023 was generally comparable to those of the 2020-2022 monitoring programs, however the species richness was the highest recorded since 2020 (12 known taxa as compared to 9-10 known taxa in years 2020 through 2022) and abundance, uncorrected for fishing effort, was the lowest since 2020 (422 individuals as compared to 482-852 individuals in 2020-2022).

Results of statistical analyses of the CPUE (i.e., catch rates corrected for fishing effort) supported the conclusion that existing mitigation measures were functioning as intended and that current Project activities were not resulting in adverse effects on the local marine fish communities in Milne Port. No reduction in fish abundance was associated with activities in the DPF; fish CPUE in the DPF was generally higher or no different than the CPUE in the IPF. Analyses of total CPUE (all fish species combined) indicated higher CPUE in the DPF compared to the IPF for angling-jigging, gill net, and hoop net catches and no effect of fishing area for angling-trolling and Fukui trap catches. For Arctic Char, there was no significant difference in CPUE between the DPF and IPF for gill netting, the only fishing method that could be analyzed. For Fourhorn Sculpin, was area comparisons of CPUE were conducted for angling-jigging and gill net fishing methods (the major methods by which Fourhorn Sculpin was captured) and both indicated CPUE was higher in the DPF compared to the IPF. This may relate to the use of constructed rocky reef habitat around the project's Ore and Freight docks by Fourhorn Sculpin.

Modifications to the monitoring program for the fish community over the past several years have focused on improving the statistical power of the monitoring. One approach to do so, that is under consideration for 2024, would be the elimination of sampling methods that yield relatively lower catches of fish, and enhanced focus on the more effective fishing methods. As in previous years, it was observed in 2023 that gill nets, angling-jigging and hoop nets were effective fishing methods. Gill nets were particularly effective for capturing Arctic Char, which were rarely caught by other methods. In most years, the majority of Fourhorn Sculpin were caught via angling-

jigging, but gill nets were more successful in capturing Fourhorn Sculpin in 2023. Trawling, while often not resulting in a high CPUE unless a school of fish were encountered, often captured taxa not sampled by the other methods used in this program. Fukui traps and angling-trolling are fishing methods that may not offer as much value as others in the program. A suggestion from the MEWG that hoop nets might replace Fukui traps resulted in a comparison of hoop net versus Fukui trap catches conducted as a three-year trial from 2020-2022. An additional year of comparative fishing was conducted in 2023 with closer matching of fishing effort and deployment location of the two methods. Over the full trial study period, hoop nets sampling events yielded twice as many captured fish (n=191 from 2020 – 2023; n=40 from 2023) compared to Fukui traps (n=75 from 2020 – 2023; n=4 from 2023), despite being deployed fewer than half the number of total efforts (i.e., sampling events) and half the number of total set hours summed over all years. The effectiveness of angling-trolling versus angling-jigging was also reviewed in 2023 to determine if one of these methods should be discontinued. Over the years 2020-2023 and the two FAs, the CPUE of angling-trolling ranged from 0-3.63 fish*hr^{-1}*rod^{-1} (with three occurrences of 0 fish*hr^{-1}*rod^{-1}) whereas CPUE of angling-jigging ranged from 0.96-8.92 fish*hr^{-1}*rod^{-1}. High occurrences of zero catch rates limited the ability to statistically analyse the angling-trolling data. Taxa captured by angling-trolling were commonly caught via other fishing methods during open-water surveys.

Measures recommended for the 2024 MEEMP sampling program include the following:

- Removal of angling-trolling and Fukui traps as fishing methods from the 2024 program due to low catch efficiency. These sampling efforts could be replaced by angling-jigging and hoop nets, respectively.
- As power analyses continued to indicate the power of statistical comparison was relatively low, due to the high variability of fish catch, the number of efforts (i.e., sampling events) per area of each fishing method (i.e., angling-jigging, gill nets, and hoop nets) should be increased in 2024 with a target of 40% effect size detection for fishing methods. Trawling would be retained in the program as a contributor to understanding fish diversity in Milne Port, but this sampling technique is not expected to meet a statistical effect size target.
- If the changes described above do not sufficiently increase statistical power to overcome the currently observed limitations on statistical power, consideration may be given to assessing differences between Fishing Areas using effect sizes rather than a strict adherence to statistical significance.

Overall, fishing methods were deemed effective in characterizing the marine fish community in terms of species presence and relative abundance. The program continues to improve its methodology with regard to efficiencies of capture, representation of the fish community, and statistical power, and the delineation of fishing areas and standardization of measures of fishing effort time series that commenced in 2021 will continue to allow for ongoing assessments of interannual change in relative fish abundance and distribution at Milne Port.

FISH HEALTH AND TISSUE CHEMISTRY (CHAPTER 7.0)

To satisfy PC Conditions No. 76, 83 (a), 99 (a), 113, and 114, sampling was conducted to assess fish health and tissue chemistry in the Milne Port area. Fish health endpoints were assessed in two species, Fourhorn Sculpin (*Myoxocephalus quadricornis*), a marine fish, and wrinkled rock-borer (*Hiatella arctica or H.arctica*), a marine bivalve. The two species were collected from the Milne Port area and two reference areas, Koluktoo Bay for the finfishes and Tugaat River Estuary for the shellfish (bivalve). Arctic Char were also included in the fish health and tissue chemistry monitoring program but were collected opportunistically from the fishing efforts in the Milne Port area only. Tissue chemistry was assessed in Fourhorn Sculpin, Arctic Char (*Salvelinus alpinus*), and *H. arctica*. Fish health assessments included consideration of survival, growth, condition, and reproductive endpoints, and were considered separately for species and sexes, as relevant. Statistical comparisons of fish health endpoints were completed between Milne Port and the reference areas for Fourhorn Sculpin and *H. arctica* using data collected in 2023, as well as among recent sampling years (i.e., 2020, 2021, 2022, and 2023) for all species.

Fourhorn Sculpin were targeted using both active (i.e., angling by jigging and trolling, trawling) and passive (i.e., Fukui traps, hoop nets, and gill netting) capture methods in the Milne Port area and the Koluktoo Bay reference area. Incidental mortalities of Arctic Char during fishing efforts were retained for analysis of age, stomach contents, and tissue chemistry. *Hiatella arctica* were collected from the Milne Port area and the Tugaat River Estuary reference area from benthic infauna samples, with specimens being selected for processing if the animal was greater than 15 mm in length with an intact shell and had no indications of damage to the umbo or hinge area. Collected fish and *H. arctica* were processed for fish health endpoints and tissues were retained for tissue chemistry analysis.

A total of 22 incidental mortalities of Arctic Char were kept in 2023, comprising five adult females, nine adult males, and eight juveniles of unknown sex. Age ranges of Arctic Char processed in 2023 (4 to 25 years) were similar to those in 2021 and 2022; however, the median age in 2022 (11.5 years) was greater than in 2021 or 2023 (8.5 and 9.0 years). Condition factor of Arctic Char differed among sampling years. Mean condition factor in 2023 was lower than in 2022 but did not differ among other years.

A total of 40 Fourhorn Sculpin were processed from the Milne Port area in 2023, comprising 20 adult females and 20 adult males. In addition, a total of 25 Fourhorn Sculpin were processed from the Koluktoo Bay reference area, comprising 18 adult females and seven adult males. Differences in fish health endpoints were observed for female and male Fourhorn Sculpin between the Milne Port area and the Koluktoo Bay reference area. Females from the Milne Port area were significantly larger at age (i.e., greater size-at-age) and heavier at length (i.e., greater relative weight), but had significantly lower relative liver and relative gonad weights compared to female fish from Koluktoo Bay. Differences in size-at-age, relative weight, and relative gonad weight exceeded the critical effect size (CES) for female fish. For male fish, mean age was significantly lower but size-at-age was significantly greater in Milne Port compared to Koluktoo Bay. The difference in size-at-age exceeded the CES for male fish. Differences in fish health endpoints were also observed for female and male Fourhorn Sculpin among sampling years within Milne Port; age, relative weight, relative liver weight, and relative gonad weight differed among sampling years for female fish, and age, size-at-age, relative weight, relative liver weight, and relative gonad weight differed among sampling years for male fish. For both sexes, no consistent trends in differences were observed for any endpoint, suggesting interannual variability was the main contributor to observed differences in Fourhorn Sculpin fish health endpoints among years.

In 2023, a total of 40 *H. arctica* were collected from Milne Port, and a total of 17 *H. arctica* were collected from the Tugaat River Estuary reference area. All individuals collected were processed for fish health endpoints. No differences in survival (as length-frequency distribution), growth (as whole animal wet weight), condition (as relative weight and relative shell weight), or reproduction (as mantle somatic index) were observed when comparing Milne Port with Tugaat River Estuary. When evaluating fish health endpoints for *H. arctica* within Milne Port among sampling years, differences were observed for whole animal wet weight, relative weight, relative shell weight, and mantle somatic index. No consistent trends in differences were observed for any endpoint, suggesting interannual variability was the main contributor to observed differences.

A total of 24 tissue samples of fish from Milne Port were submitted for tissue chemistry metals analysis in 2023, from Arctic Char (n = 8), Fourhorn Sculpin (n = 8), and *H. arctica* (n = 8). An additional 12 samples from each of Fourhorn Sculpin and *H. arctica* collected from the reference areas were submitted for metals analysis in 2023. Constituents of potential concern (COPCs) were identified based on the primary constituents of the Project iron ore (i.e., aluminum, magnesium, and iron), as well as metals with existing regulatory guidelines for fish tissue (i.e., mercury and selenium). Statistical comparisons of COPCs (i.e., aluminum, iron, magnesium, mercury, and selenium) were completed for each species, separately, between the Milne Port area and the relevant reference area within 2023, as well as among sampling years (i.e., 2018 to 2023). Other metals were considered qualitatively for general trends over time.

When comparing Fourhorn Sculpin and *H. arctica* tissue chemistry between the Milne Port area and relevant reference areas, few differences were observed. Concentrations of most metals in Fourhorn Sculpin tissues were similar among sampling areas, although some metals exhibited greater spatial variability (e.g., arsenic, lead, manganese). Concentrations of COPCs were generally not different between sampling areas, with the exception of selenium: after adjusting for fish length, selenium concentrations were significantly lower (-12%) in Milne Port compared to Koluktoo Bay. For *H. arctica*, concentrations of most metals were similar among sampling areas; measured concentrations of beryllium, lead, silver, and uranium in samples from the Tugaat River Estuary appeared to be greater than the range of measured concentrations in Milne Port. Concentrations of COPCs were generally not different between sampling areas, with the exception of magnesium. Mean magnesium concentrations were significantly greater in samples from Milne Port compared to Tugaat River Estuary: the magnitude of effect, 82%, was below the CES.

Among sampling years at Milne Port, concentrations of most metals were similar within each species, although some metals exhibited greater interannual variability (e.g., copper, nickel, tin). For Arctic Char, significant increasing trends in iron and magnesium concentrations were observed. Median concentrations of both metals exhibited appreciable interannual variability but were either stable or decreased in 2023 from previous years. For Fourhorn sculpin, no significant increasing trends were observed; significant decreasing trends were observed for aluminum and iron. These trends are considered not indicative of a Project-related effect and were not considered further. For *H. arctica*, significant increasing trends were observed for iron and selenium concentrations. Median concentrations of both metals exhibited relative stability from 2019 to 2023, with minor differences between years.

Mercury and selenium concentrations in all Arctic Char and Fourhorn Sculpin samples were below Health Canada's Maximum Levels for Chemical Contaminants in Foods mercury consumption guideline of 0.5 mg/kg ww (Health Canada 2015) and the BC Ministry of Environment selenium concentration guidelines of 4 mg/kg dw (BC MOE 2014), respectively. In *H. arctica*, mercury concentrations were compared with the Health Canada consumption guideline for context, as this is not a common food shellfish species. Mercury concentrations in *H. arctica* were below the Health Canada consumption guideline.

A total of eight Arctic Char samples, eight Fourhorn Sculpin samples, and four *H. arctica* composite samples from Milne Port were analyzed for polycyclic aromatic hydrocarbons (PAHs) in 2023. An additional nine samples from Fourhorn Sculpin and *Hiatella arctica* collected from the reference areas were submitted for PAH analysis in 2023. Concentrations of all PAHs in all species were below reported detection limits (<0.050 mg/kg ww).

Assessments of fish health and tissue chemistry in 2023 for Arctic Char, Fourhorn Sculpin, and *H. arctica* indicated low magnitude differences in endpoints over time and among sampling areas, suggesting inherent interannual variability in endpoints. Sample timing continued to be appropriate for the assessment of reproductive endpoints for Fourhorn Sculpin and *H. arctica*. All results are within FEIS predictions, which indicated the potential for low magnitude effects on marine fish health and tissue chemistry. There was no evidence for Project-related effects beyond the magnitude of FEIS predictions on fish health or tissue chemistry in 2023.

NON-INDIGENOUS SPECIES AND AQUATIC INVASIVE SPECIES (NIS/AIS) MONITORING (CHAPTER 8.0)

This chapter presents the results of comprehensive sampling conducted in the marine environment of Milne Inlet to monitor for the presence of non-indigenous species (NIS) and aquatic invasive species (AIS), fulfilling PC Conditions No. 87, 89, and 91. The sampling program included both targeted (e.g., benthic grabs, settlement plates, and zooplankton tows) and general (e.g., screening all species identified through MEEMP components, such as fish, benthic fauna and macroflora surveys) sampling efforts. All observed and sampled taxa were compared to a taxonomic inventory for Milne Inlet, which has been developed over time (starting with pre-Project baseline) and is updated annually. Species composition in the region is relatively unknown and it is expected that each year this sampling program will detect taxa that were not previously recorded. Literature reviews were performed on any taxa that were not part of the inventory to investigate their biogeographic range on record; in addition, these taxa were cross-referenced against both global and domestic databases of known invasive taxa. Taxa were also cross-referenced with the Program-specific Watch List (taxa flagged for ongoing monitoring and re-assessment) comprised of taxa assessed to be either:

No risk: A species is considered to be “No Risk” if it is:

- reported to be present in the Canadian Arctic (or, its distribution in waters adjacent to the Canadian Arctic provides high certainty that its range includes the Canadian Arctic), prior to Project operations or in areas outside the Project’s area of influence
- not listed on AIS databases, or if listed it is native to Canadian Arctic or (in the case of higher taxon identification, with one or more representative species listed on an AIS database) the representative species is/are unlikely to establish in the Arctic (e.g., tropical/subtropical)

Low risk: A species is considered to be “Low Risk” if it is:

- not reported to be present in the Canadian Arctic or there is low certainty as to its presence, or identity is uncertain, or taxon is undergoing natural range expansion
- not listed on AIS databases, or (in the case of higher taxon identification, with one or more representative species listed on an AIS database) the representative species is/are unlikely to establish in the Arctic (e.g., tropical/subtropical)

Moderate risk: A species is considered to be “Moderate Risk” if it is:

- not reported to be present in the Canadian Arctic
- capable of using shipping vectors
- listed as an AIS in other areas, but has shown no invasive behaviours in Milne Inlet

High risk: A species is considered to be “High Risk” if it is:

- not reported to be present in the Canadian Arctic
- capable of using shipping vectors
- listed as an AIS in other areas
- well-documented as having potentially serious invasive behaviours elsewhere, and/or has shown invasive behaviours in Milne Inlet

Taxa placed on the Watch List include low- to high-risk taxa that require more supportive data, e.g., to confirm their identity or determine population trends. Should high-risk taxa be identified that are considered potentially introduced via Project shipping activities, they would be added to the Trigger List (a list of species that “trigger” development of a Rapid Response Plan outlining responsive actions which will be species specific and proportional to the risk).

The 2023 surveys resulted in 31 new additions to the taxonomic inventory for Milne Inlet (i.e., taxa that had not been observed in previous surveys). All new taxa had records of occurrence in the Canadian Arctic, or described ranges that were likely to include the Project area. Results remain pending for macroflora identifications as well as genetic analysis of macroflora and animal taxa.

Additionally, NIS/AIS monitoring in 2023 collected five taxa that were placed on the Watch List in previous years due to uncertainties in their natural range or because they were listed in an existing AIS database (the polychaetes *Marenzelleria* sp.*, Hesperonoe* sp., *Sosane wireni*, and *Paramphitrite birulai*, as well as the amphipod *Crassicorophium* sp.). Specimens of *Hesperonoe* sp. were sent to taxonomic experts for independent verification along with specimens collected in 2022. All other Watch List taxa were previously sent for independent verification with specialists and the newly collected specimens were not submitted for additional review. Distribution and abundance of each Watch List taxon was compared to previous years to identify meaningful trends in abundance or distribution since the taxon was first observed in Milne Port that may signal the onset of invasive behaviours.

Updates were provided for two algal specimens collected in 2022 that were identified as cf. *Punctaria latifolia* and cf. *Stictyosiphon soriferus* and were flagged for further review, as well as an unidentified Bryophyta that was sent to an expert for further identification.

No new taxa were added to the Watch List in 2023, while one taxon (*Sosane wireni*) was removed due to records indicating a probable range that extends to the Eastern Canadian Arctic. Following this change, the Watch List consisted of eight taxa. There are no species on the Trigger List.

The Baffinland NIS/AIS monitoring program represents the most comprehensive monitoring program for NIS/AIS conducted by a marine port in Canada. Approximately 1,062 taxa have been identified in Milne Inlet through monitoring to date, which included 410 unique macroflora, zooplankton, benthic invertebrates, and fish species. The identification and risk assessment of individual taxa out of the hundreds identified in Milne Inlet indicated this surveillance program was effective and functioning as intended. The vast majority of these taxa have been designated as "No Risk" and are not considered to be of concern.

Study Limitations

WSP has prepared this document in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practicing under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this document. No warranty, express or implied, is made.

This document, including all text, data, tables, plans, figures, drawings and other documents contained herein, has been prepared by WSP for the sole benefit of Baffinland Iron Mines Corporation (Baffinland). The Executive Summary was translated into Inuktitut and provided by Baffinland to WSP. In the event of discrepancies in information or interpretation, the English version shall prevail. This report represents WSP's professional judgement based on the knowledge and information available at the time of completion. WSP is not responsible for any unauthorized use or modification of this document. All third parties relying on this document do so at their own risk.

The factual data, interpretations, suggestions, recommendations, and opinions expressed in this document pertain to the specific project, station conditions, design objective, development and purpose described to WSP by Baffinland, and are not applicable to any other project or station location. In order to properly understand the factual data, interpretations, suggestions, recommendations and opinions expressed in this document, reference must be made to the entire document.

This document, including all text, data, tables, plans, figures, drawings and other documents contained herein, as well as all electronic media prepared by WSP are considered its professional work product and shall remain the copyright property of WSP. Baffinland may make copies of the document in such quantities as are reasonably necessary for those parties conducting business specifically related to the subject of this document or in support of or in response to regulatory inquiries and proceedings. Electronic media is susceptible to unauthorized modification, deterioration, and incompatibility and therefore no party can rely solely on the electronic media versions of this document.

ACRONYMS AND ABBREVIATIONS

Acronym or Abbreviation	Definition
AIS	Aquatic Invasive Species
ANOVA	Analysis of Variance
BACI	Before/After Control/Impact
Baffinland	Baffinland Iron Mines Corporation
BC	British Columbia
BC MOE	BC Ministry of Environment and Climate Change Strategy
BOD	Biological Oxygen Demand
CCME	Canadian Council of Ministers of the Environment
CES	Critical Effect Size
CGVD	Canadian Geodetic Vertical Datum
CPUE	Catch per unit effort
DFO	Fisheries and Oceans Canada
DL	Detection Limit
DPF	Direct Project Footprint

1.0 INTRODUCTION

Baffinland Iron Mines Corporation (Baffinland) completed its ninth consecutive year of the marine environmental effects monitoring program (MEEMP) and non-indigenous/aquatic invasive species (NIS/AIS) monitoring program for the Mary River Project (the Project). This report presents the results for the 2023 field programs conducted in Milne Inlet during the open-water season. Both the MEEMP and NIS/AIS programs were originally developed in 2015 following completion of marine baseline studies in Milne Port during 2013 and 2014 and are intended to provide a primary means to identify and quantify potential Project-related changes in the marine environment. Where such changes occur, the programs assist in identifying appropriate modifications to, or mitigation of, Project operational activities to avoid and/or minimize potential adverse effects on the marine environment. Results from the MEEMP and NIS/AIS monitoring programs also provide information to the Nunavut Impact Review Board (NIRB) to support its annual review of the Mary River Project.

1.1 Project Context

The Project is an operating open pit iron ore mine owned by Baffinland and located in the Qikiqtani Region of North Baffin Island, Nunavut (Figure 1-1). The operating mine site is connected to Milne Port, located at the head of Milne Inlet, via the 100 km long Milne Inlet Tote Road. An approved (Project Certificate 005, issued by the Nunavut Impacts Review Board in 2012) but as-yet undeveloped component of the Project includes a South Railway connecting the Mine Site to an undeveloped port at Steensby Inlet (Steensby Port).

In 2014, Baffinland received approval (Project Certificate 005, Amendment 1) to operate the Early Revenue Phase (ERP) of the Project. The ERP authorized Baffinland to transport 4.2 Mtpa (million tonnes per annum) of ore by truck to Milne Port for shipping through the Northern Shipping Route (encompassing Milne Inlet, Eclipse Sound, and adjacent water bodies) using chartered ore carrier vessels. Baffinland shipped ~918,000 tonnes of iron ore from Milne Port during the first year of ERP operations in 2015, 2.6 Mtpa in 2016, and 4.1 Mtpa in 2017. Following approval of production increases allowing Baffinland to ship 6.0 Mtpa in 2018-2022 (Amendments 2, 3 and 4), annual totals of 5.1 Mtpa (2018), 5.9 Mtpa (2019), 5.5 Mtpa (2020), 5.6 Mtpa (2021) and 4.7 Mtpa (2022) of iron ore were shipped from Milne Port. In 2023, Amendment 5 (Sustainable Operations Proposal) was approved, and will be in effect until 31 December 2024. This amendment allows a maximum of 6.0 Mtpa of iron ore to be transported on the Tote Road in any calendar year, but an additional 0.9 Mtpa of ‘stranded ore’ may be shipped in the 2023 and 2024 shipping seasons. ‘Stranded ore’ is defined as iron ore that was delivered to Milne Port in the previous year but was not shipped due to weather or other shipping constraints. Amendment 5 also set the maximum number of ore carriers as 84 ore carriers per year in the 2023 and 2024 shipping season. In 2023, 6.02 Mtpa of iron ore were shipped from Milne Port in 75 ore carriers.

1.2 Background

As a part of regulatory commitments, Baffinland has developed and implemented a multi-disciplinary Marine Environmental Effects Monitoring Program (MEEMP). The MEEMP is designed to evaluate potential Project-related effects on the marine environment as predicted in the Final Environmental Impact Statement (FEIS) and FEIS addenda (Baffinland 2012, 2013); predictions, associated mitigation measures, and current status are presented in Table 1-1 below.

The MEEMP includes monitoring of marine water and sediment quality, invertebrates, vegetation, and fish and fish habitat. The MEEMP sampling design is generally based on the Metal Mining Environmental Effects Monitoring technical guidelines (Environment Canada 2012) and includes statistical approaches for detecting potential Project-induced impacts on the marine environment. NIS/AIS monitoring is an integral component of the MEEMP and is designed to address the potential risks of species introductions to the marine environment from ships' ballast water and hull biofouling.

Sikumiut Environmental Management Ltd. (SEM) was originally retained by Baffinland to design and implement the MEEMP. The MEEMP program was first implemented in 2015, at which time monitoring efforts focused primarily on further characterization of baseline conditions in Milne Port prior to commencement of Project operations in 2015 (SEM 2015). Environmental effects monitoring was completed by SEM in 2015 and 2016. Golder Associates Ltd. (now known as WSP Canada Inc.) completed environmental effects monitoring from 2017 through 2023, which included modifications to the 2015-2016 MEEMP and NIS/AIS sampling design to better address the objectives of the programs. Modifications to the program since 2015 are summarized in Table 1-6.

1.3 Objectives

This report presents the results of the MEEMP and NIS/AIS monitoring programs conducted in Milne Inlet during the 2023 open-water season.

In accordance with existing Terms and Conditions of Project Certificate (PC) No. 005, Baffinland is responsible for the establishment and implementation of the MEEMP, which comprises monitoring studies that are conducted over a defined time period with the following objectives:

- Assess the accuracy of effects predictions in the FEIS (Baffinland 2012) and subsequent addenda.
- Assess the effectiveness of Project mitigation measures.
- Verify compliance of the Project with regulatory requirements, permits, standards, and policies.
- Identify unforeseen adverse effects and provide early warnings of undesirable changes in the environment.
- Improve understanding of local environmental processes and potential Project-related cause-and-effect relationships.
- Provide feedback to the applicable regulators (e.g., NIRB) and advisory bodies (e.g., Marine Environmental Working Group [MEWG]) with respect to the following:
    - Potential adjustments to existing monitoring protocols or monitoring framework to allow for the most scientifically defensible synthesis, analysis, and interpretation of data.
    - Considerations for the modification of operational practices where and when necessary.

Table 1-1: Summary of Predictions from FEIS and subsequent addenda for Milne Port, Associated Mitigation Measures, and Current Status

Predictions				Relevant MEEMP Section	Current Status
VEC[1]	Activity	Impact/Significance	Associated Mitigation Measures		
Water and Sediment Quality	Barge and ship traffic to/from Milne Inlet	Negligible effects to total suspended solids (TSS), nutrient, or metal concentrations in the water or sediment due to resuspension of substrates from propeller currents; expected that the new equilibrium state will be reached early within the operation phase of the Project.	▪ Section 4.9 Sediment Erosion Control of the Environmental Protection Plan outlines measures such as use of silt curtains and drainage ditches, as well as treatment and testing of effluent/run-off prior to discharge, to mitigate potential effects to water and sediment quality (Baffinland 2021b). ▪ Emergency Response and Spill Contingency Plans outline measures to mitigate potential fuel spills (Baffinland 2020; Baffinland 2021c). ▪ Shipping and Marine Wildlife Management and Ballast Water Management plans outline measures to mitigate potential effects associated with vessel traffic such as a mandatory mid-ocean ballast water exchange and compliance with Anti-Fouling Systems Convention (Baffinland 2021d; Baffinland 2019).	Chapter 2.0 Chapter 3.0 Chapter 5.0	No indications of impacted marine water or sediment quality. Measured metals concentrations are low, typically below applicable guidelines, and generally consistent with previous years. No observation of ore dust deposition in substrate. Grain size composition analysis indicates high spatial and temporal variability in fines content, driven by natural factors, as well as potential influences of vessel propeller wash, which is expected to stabilize over time. To date, 2020 was the only instance where reduced fines content was accompanied by a substantial reduction in benthic density, richness and diversity; Conditions at the affected station rebounded in 2021, 2022 and 2023 indicating effects are temporary and localized.
		No anticipated increases in hydrocarbon concentrations in water or sediments through normal vessel operations.			
	Discharge of ballast water	Open-water season: no anticipated effects to water or sediment quality.			
		Ice-cover season: increases in temperature and nitrate concentrations in the water; increases in nitrogen concentrations in the sediment; no anticipated changes in the concentrations of metals or other nutrients in water or sediment.			
	Dispersion and deposition of dust from the ore stockpile	Increases in concentrations of TSS and metals (primarily iron) in the water.			
		Increases in concentrations of metals (primarily iron) in the sediment.			
	Discharge of wastewater and site run-off	Increases in biological oxygen demand (BOD) and concentrations of TSS, nutrients, metals, and hydrocarbons in the water.			
		Increases in concentrations of nutrients, metals, and hydrocarbons in the sediment.			

Predictions				Relevant MEEMP Section	Current Status
VEC[1]	Activity	Impact/Significance	Associated Mitigation Measures		
Marine Fish Habitat	Habitat Alteration (Sediment introduction and resuspension)	Wastewater discharge and site runoff may introduce TSS into the water column, increasing the amount of fine-grained sediments in the immediate vicinity of the discharge point.	▪ Sediment and Erosion Control Plan (Section 4.9 of the Environmental Protection Plan) outlines measures such as use of silt curtains and drainage ditches, as well as treatment and testing of effluent/run-off prior to discharge, to mitigate potential effects to water and sediment quality (Baffinland 2021b). ▪ Emergency Response and Spill Contingency Plans outline measures to mitigate potential fuel spills (Baffinland 2020; Baffinland 2021c) ▪ Shipping and Marine Wildlife Management and Ballast Water Management plans outline measures to mitigate potential effects associated with vessel traffic such as a mandatory mid-ocean ballast water exchange and compliance with Anti-Fouling Systems Convention (Baffinland 2021d; Baffinland 2019). ▪ Minimize vessel operations to the extent possible. ▪ Mitigation by design and through compliance of Fisheries and Oceans Canada's (DFO) no net loss habitat policy.	Chapter 2.0 Chapter 3.0 Chapter 4.0 Chapter 5.0 Chapter 8.0	No indications of impacted marine sediment quality. Measured metals concentrations were low, typically below applicable guidelines, and/or generally consistent with previous years. No observance of ore dust deposition in substrate Generally, no evidence of altered benthic infauna, epifauna, or macroflora community composition or productivity. No consistent temporal and spatial trends that would be indicative of Project impacts. In 2020, one station, SW-2, showed signs of propeller wash effects (i.e., lower density and diversity metrics, accompanied by reduced fines content), conditions in 2021, 2022 and 2023 rebounded substantially, indicating that effects were temporary and localized.
		Potential increases in concentrations of TSS in the water column and accumulation of fines in the sediments could alter the nearshore habitat, although tidal fluxes are expected to disperse the effluents and minimize effects on habitat.			
	Habitat Alteration (Substrate alteration)	Sediment resuspension due to occasional (<1 per year) vessels and propeller-generated currents expected to lessen as fine-grained sediments on seabed are removed and seabed sediment composition stabilizes.			
		Removal of fine-grained sediments may alter benthic community composition.			
	Habitat Alteration (Noise disturbance)	Intermittent noise disturbance due to occasional vessel operations and loading activities.			
	Habitat Alteration (Fugitive ore dust deposition)	Fugitive ore dust deposition to marine environment.			
		Possible change to water and sediment chemistry and seabed grain size composition.			
		Possible change to benthic productivity.			

Predictions				Relevant MEEMP Section	Current Status
VEC[1]	Activity	Impact/Significance	Associated Mitigation Measures		
Arctic Char (*Salvelinus alpinus*) Health	Sediment Resuspension	Increases in concentrations of TSS, nutrients, and metals in the water column as a result of sediment disturbance from propeller currents are expected infrequently during operation. Short-term exposure of Arctic Char to these conditions has minimum potential to affect fish health.	■ Sediment and Erosion Control Plan (Section 4.9 of the Environmental Protection Plan) outlines measures such as use of silt curtains and drainage ditches, as well as treatment and testing of effluent/run-off prior to discharge, to mitigate potential effects to water and sediment quality (Baffinland 2021b). ■ Emergency Response and Spill Contingency Plans outline measures to mitigate potential fuel spills (Baffinland 2020; Baffinland 2021c). ■ Shipping and Marine Wildlife Management Plan outline measures to mitigate potential effects associated with vessel traffic such as a mandatory mid-ocean ballast water exchange and compliance with Anti-Fouling Systems Convention (Baffinland 2021d; Baffinland 2019).	Chapter 6.0 Chapter 7.0	No indications of reductions in abundances of Arctic Char and other fish species associated with Project activities. No notable trends observed in tissue concentrations of constituents of potential concern (e.g., aluminum, iron, magnesium, mercury, and selenium) over time, which were within FEIS predictions of low magnitude effects.
		The redistribution of sediments near the docks is not expected to directly affect fish health or condition.			
		Slight reductions in nutrient concentrations and short-term, localized increases water temperature in Milne Inlet are expected to have negligible effects on fish health and condition.			
		Metal concentrations in water and fish tissues are not expected to change.			
		Potential increases in metal and hydrocarbon concentrations in fish tissues and reductions in fish health and condition are possible as a result of release of site drainage (with elevated BOD and concentrations of TSS, nutrients, metals, and hydrocarbons) to the marine environment.			
		Combined effluents will be tested to ensure that they are not acutely toxic.			

[1] VEC = Valued Ecosystem Component

The MEEMP was developed in consideration of the anticipated and potential Project-related impacts to the marine environment as identified in the 2012 FEIS and subsequent addenda (Baffinland 2012; 2013) as well as monitoring requirements outlined in several PC Terms and Conditions; relevant PC conditions are listed in Table 1-2 along with the chapters in which the conditions are addressed through the MEEMP-NIS/AIS program.

Table 1-2: PC Conditions Relevant to MEEMP Surveys[1]

PC Condition	Description	Relevant MEEMP Chapter(s)
76	The Proponent shall develop a comprehensive Environmental Effects Monitoring Program to address concerns and identify potential impacts of the Project on the marine environment. The Marine Environmental Effects Monitoring Program shall include: (a) A summary of the monitoring conducted by the Proponent to identify potential project effects in the marine environment; (b) The comparison of impact predictions provided by the Proponent in the Final Environmental Impact Assessment (FEIS), FEIS Addendum and/or any other assessments provided to the Board; (c) The identification of mitigation measures the Proponent has implemented to protect the marine environment; (d) Any adaptive management plans developed/implemented to prevent, manage or mitigate effects in the marine environment; (e) A discussion of how relevant Inuit Qaujimajatuqangit, scientific and/or technical knowledge and industry best practices have been incorporated into the Program and have informed the components of the Program; and (f) The identification of changes to the Program that may be required to ensure that potential adverse effects to the marine environment are prevented, that adaptive management occurs, and that mitigation measures are effective.	Chapter 2.0 Chapter 3.0 Chapter 4.0 Chapter 5.0 Chapter 6.0 Chapter 7.0 Chapter 8.0
1 and 83	The Proponent shall use GPS monitoring or a similar means of monitoring at both Steensby Port and Milne Port, with tidal gauges to monitor the relative sea levels and storm surges at these sites.	N/A
83(a)	The Proponent shall conduct hydrodynamic modelling in the Milne Inlet Port area to determine the potential impacts arising from disturbance to sediments including re-suspension and subsequent transport and deposition of sediment. The modelling results shall be used to update the marine water and sediment quality monitoring and mitigation program to include activities associated with the construction and mitigation of the Milne Inlet Port. In the 2023 Annual Report, the Proponent is required to provide the Board with updates to the marine water and sediment quality monitoring and mitigation program necessary to reflect the increased use of larger ore vessels (Baby Cape and Capesize) at Milne Port. The monitoring program shall include an ongoing assessment of the potential introduction of metals that bio-accumulate in the marine food chain.	Chapter 2.0 Chapter 3.0 Chapter 5.0 Chapter 7.0
84	The Proponent shall update its sediment redistribution modeling once ship design has been completed and sampling should be undertaken to validate the model and to inform sampling sites and the monitoring plan.	Chapter 3.0 Chapter 5.0

[1] Conditions 76, 83(a), 85 and 99 as shown here were modified for the Sustaining Operations Proposal in 2023 by NIRB in Amendment 5 to the Project Certificate.

PC Condition	Description	Relevant MEEMP Chapter(s)
85	The Proponent shall develop a monitoring plan to verify its impact predictions associated with sediment redistribution resulting from propeller wash in shallow water locations along the shipping route. If monitoring detects negative impacts from sediment redistribution, additional mitigation measures will need to be developed and implemented. In the 2023 Annual Report, the Proponent is required to identify updates to the monitoring plan to reflect the increased use of large ore vessels (Baby Cape and Capesize) at Milne Port.	Chapter 3.0
86	Prior to commercial shipping or iron ore, use more detailed bathymetry collected from Steensby and Milne Inlets to model anticipated ballast water discharges from ore carriers. This information should be used to update ballast water discharge impact predictions and sampling should be conducted to validate the model.	N/A
87	The Proponent shall develop a detailed monitoring program at a number of sites over the long term to evaluate changes to marine habitat and organisms and to monitor for non-native introductions resulting from Project-related shipping. This program needs to be able to detect changes that may have biological consequences and should be initiated several years prior to any ballast water discharge into Steensby Inlet and Milne Inlet to collect sufficient baseline data and should continue over the life of the Project.	Chapter 2.0 Chapter 3.0 Chapter 4.0 Chapter 5.0 Chapter 6.0 Chapter 7.0 Chapter 8.0
89	The Proponent shall develop and implement an effective ballast water management program that may include the treatment and monitoring of ballast water discharges in a manner consistent with applicable regulations and/or exceed those regulations if they are determined to be ineffective for providing the desired and predicted results. The ballast water management program shall include, without limitation, a provision that requires ship owners to test their ballast water to confirm that it meets the salinity requirements of the applicable regulations prior to discharge at the Milne Port, and a requirement noting that the Proponent, in choosing shipping contractors will, whenever feasible, give preference to contractors that use ballast water treatment in addition to ballast water exchange.	Chapter 2.0 Chapter 8.0
91	The Proponent shall develop a detailed monitoring plan for Steensby Inlet and Milne Inlet for fouling that complies with all applicable regulatory requirements and guidelines as issued by Transport Canada, and includes sampling areas on ships where antifouling treatment is not applied such as the areas where non-native species are most likely to occur.	Chapter 8.0
99(a)	Establish shipping season, inter-annual baseline in Steensby Inlet and Milne Inlet that enables effective monitoring of physical and chemical effects of ballast water releases, sewage outfall, and bottom scour by ship props, particularly downslope and downstream from the docks. This shall include the selection and identification of physical, chemical, and biological community/indicator components. The biological indicators shall include both pelagic and benthic species but with emphasis on relatively sedentary benthic species (e.g., sculpins).	Chapter 2.0 Chapter 3.0 Chapter 4.0 Chapter 5.0 Chapter 6.0 Chapter 7.0 Chapter 8.0
99(b)(ii)	The collection of additional baseline data in Milne Inlet on narwhal (*Monodon monoceros*), bowhead whale (*Balaena mysticetus*) and anadromous Arctic Char abundance, distribution ecology and habitat use.	Chapter 6.0

PC Condition	Description	Relevant MEEMP Chapter(s)
99(c)	Enhance baseline data on marine wildlife (fish, invertebrates, birds, mammals, etc.) and to provide more details on species abundance and distribution found in the Project area.	Chapter 4.0 Chapter 5.0 Chapter 6.0 Chapter 8.0
113	The Proponent shall conduct monitoring of marine fish and fish habitat, which includes but is not limited to, monitoring for Arctic Char stock size and health condition in Steensby Inlet and Milne Inlet, as recommended by the MEWG.	Chapter 6.0 Chapter 7.0
114	In the event of the development of a commercial fishery in the Steensby Inlet area or Milne Inlet-Eclipse Sound areas, the Proponent, in conjunction with the Marine Environment Working Group, shall update its monitoring program for marine fish and fish habitat to ensure that the ability to identify Arctic Char stock(s) potentially affected by Project activities and monitor for changes in stock size and structure of affected stocks and fish health (condition, taste) is maintained to address any additional monitoring issues identified by the MEWG relating to the commercial fishery.	Chapter 6.0 Chapter 7.0
126	The Proponent shall design monitoring programs to ensure that local users of the marine area in communities along the shipping route have opportunity to be engaged throughout the life of the Project in assisting with monitoring and evaluating potential Project-induced impacts and changes in marine mammal distributions.	Chapter 4.0 Chapter 6.0

1.4 VECs and Indicators

1.4.1 VECs and Criteria for Magnitude Determination

The original MEEMP design in 2015 and 2016 was based on indicators and thresholds as presented in the FEIS, centred around three Valued Ecosystem Components (VECs): Marine Water and Sediment Quality, Marine Fish Habitat and Arctic Char Health.

Indicators used to determine the magnitude thresholds were based on guidelines, where available (Table 1-1). A reduction in productive capacity (measured as a proportion of lost or altered habitat to the total area of the Local Study Area[2], or LSA) was used as an indicator for the Marine Fish Habitat VEC (Baffinland 2012 and 2013). Thresholds were established based on degree of exceedance relative to guidelines. For certain parameters where no guidelines or quality criteria exist, the MEEMP used a significance criterion of two standard deviations of the baseline year as a threshold (Baffinland 2016).

The assessment predicted that Project activities may result in localized changes above threshold values for VECs, confined within the LSA. It was predicted that changes would not exceed thresholds for the Marine Fish Habitat VEC. All predicted residual environmental effects were rated as “Not Significant” since they were localized within the LSA (Table 1-1, Baffinland 2012 and 2013).

[2] The LSA includes all marine waters where there exists a reasonable potential for direct measurable effects from Project activities on the marine environment.

1.4.2 Indicators and Thresholds Currently Used for the MEEMP

Since 2016, the MEEMP and NIS/AIS program study design has evolved through consultation with regulatory agencies and Inuit organizations, as well as in response to recommendations made in previous survey years. Modifications to study designs are discussed in Sections 1.5.3.1 and 1.5.4.1. Changes to the program have also included updates or additions to the indicators and thresholds used to determine potential Project-related impacts to the environment in Milne Port. Sampling parameters and indicators are summarized in Table 1-3.

Several components of the MEEMP (e.g., marine water quality, marine sediment quality, benthic infauna, fish health) have indicators, thresholds and risk categories that are part of Baffinland's Trigger Action Response Plan (TARP), an adaptive management process (Baffinland 2021a; Baffinland 2024). New for 2023, the categories of risk assessment used in the NIS/AIS program have been adjusted to align with the TARP.

Indicators analysed for the MEEMP-NIS/AIS program are summarized in (Table 1-3), including those applicable to TARP, which are presented in more detail with their thresholds and risk categories in Table 1-4.

Table 1-3: Sampling Parameters and Indicators for the 2023 MEEMP and NIS/AIS Monitoring Program

MEEMP-NIS/AIS Program Component	Indicators	Context
Marine Water Quality	Metals[1] Total Suspended Solids[1] Nutrients[1] Hydrocarbons[1]	Temporal
Marine Sediment Quality	Percent Fines[1] Nutrients[1] Metals[1] Hydrocarbons[1]	Spatial Temporal
Benthic Invertebrates	Total Density[1] Taxa Richness[1] Simpson's Diversity Index[1] Simpson's Evenness Index[1]	Spatial Temporal
Substrate, Macroflora, and Epifauna	Percent Cover/Density Taxa Richness Simpson's Diversity Index	Spatial Temporal
Fish Population	Taxa Richness Relative Abundance Arctic Char Catch Per Unit Effort (CPUE) Total Fish Catch Per Unit Effort (CPUE)	Spatial Temporal
Fish Health	Survival Growth Condition[1] Reproduction	Spatial Temporal
Fish Tissue Chemistry	Metals[1] Polycyclic Aromatic Hydrocarbons (PAHs)	Spatial Temporal
NIS/AIS	Presence of NIS or AIS[1]	No Context

[1] Indicator is used in the TARP

The TARP uses effect indicators that are measured against a series of tiered thresholds (i.e., low, moderate and high-risk thresholds) (Table 1-4) that are designed to guide short-term and long-term adaptive management strategies as outlined in Baffinland (2024). Baffinland has updated the TARP as part of the revised draft Marine Monitoring Plan (MMP) (Baffinland 2023). The pre-defined actions identified in the TARP describe the responses that Baffinland would implement should the corresponding threshold levels be exceeded and assuming there is some degree of certainty that the measured change is Project-related. These responses range from increased monitoring and data analysis (e.g., trend analysis); identification of possible sources; to risk assessment and/or mitigation and are described in Baffinland (2024). As adaptive management is beyond the scope of the MEEMP-NIS/AIS monitoring program, only the draft indicators and thresholds are presented here (Table 1-4).

Table 1-4: Marine Environment Trigger Action Response Plan (TARP) Indicators, Condition Status, and Thresholds

(a) Water Quality

Component	Performance Indicators	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Water Quality	▪ Metals ▪ TSS ▪ Hydrocarbons ▪ Nutrients	30-day mean concentration of a parameter is greater than 75% of an applicable CCME long-term guideline[1]. AND Effluent monitoring and spatial and temporal water quality data suggest a pattern indicative of effects from the Port's effluent discharge	Confirmed[2] exceedance of an effects benchmark or an applicable CCME long-term guideline[2] by a mean concentration. AND Effluent monitoring and spatial and temporal water quality data suggest that the confirmed increase in this parameter is related to the Port's effluent discharge.	To be determined based on outcome of moderate response investigations.

[1] Canadian Council of Minsters of the Environment (CCME) water quality guidelines for the protection of marine aquatic life. With the exception of silver, total suspended solids (TSS), and turbidity, these are long-term water quality guidelines intended to be applied to the average concentration at a receiving environment station collected over a 5-in-30 sampling program (i.e., average of 5 discrete samples collected over a 30-day period). In lieu of a long-term guideline for silver, the short-term guideline will be applied to discrete measured concentrations. The long-term guidelines for TSS and turbidity will be used.

[2] Confirmed indicates that the Risk Status/ Threshold trigger has been observed in at least two consecutive monitoring programs, whether during the regular monitoring schedule or confirmed through a special study.\

(b) Sediment Quality

Component	Performance Indicators	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Sediment Quality	▪ Particle Size ▪ Nutrients ▪ Metals ▪ Hydrocarbons	Measured concentrations of a parameter at one or more stations are > the CCME[1] ISQG or another relevant lower bound guideline, and are higher than background concentrations. AND Spatial and temporal sediment trend analysis suggest a pattern indicative of Port-related effects beyond FEIS predictions.	Measured concentrations of a parameter at one or more stations are > the CCME PEL or another relevant upper bound guideline[1]. AND Spatial and temporal sediment trend analysis suggest a pattern indicative of Port-related effects beyond FEIS predictions. AND Sediment toxicity testing as a special study indicates a Port-related effect.	To be determined based on outcome of moderate response investigations.

[1] Canadian Council of Minsters of the Environment (CCME 1999) sediment quality guidelines for the protection of marine aquatic life.
ISQG = Interim Sediment Quality Guideline; PEL = Probable Effect Level.

(c) Benthic infauna

Component	Performance Indicators	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Benthic Infauna	▪ Density ▪ Taxa Richness ▪ Simpson's Diversity Index ▪ Simpson's Evenness Index	Spatial and temporal trend analysis for density or taxa richness suggest a pattern indicative of Port-related effects beyond FEIS predictions. AND Low Risk Status/Threshold is triggered for sediment.	Spatial and temporal trend analysis for density and taxa richness suggest a pattern indicative of Port-related effects beyond FEIS predictions. AND Moderate Risk Status/Threshold is triggered for sediment.	To be determined based on outcome of moderate response investigations.

(d) Fish health

Component	Performance Indicators[3]	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Fish Health	Fourhorn Sculpin ▪ Age ▪ Size-at-age (i.e., total weight at age) ▪ Condition as relative weight (i.e., total weight at total length) ▪ Relative liver weight (i.e., liver weight at total weight) ▪ Relative gonad weight (i.e., gonad weight at total weight) *Hiatella arctica* ▪ Length-frequency analysis ▪ Whole animal wet weight ▪ Condition as relative weight (i.e., whole animal wet weight at total length) ▪ Relative shell weight (i.e., dry shell weight at total length) ▪ Relative gonad weight (i.e., gonad weight at whole animal wet weight)	A statistically significant difference ($P < 0.1$) in effect indicators[8] relative to the reference area and change is in direction that indicates an impairment to fish health and is of magnitude greater than or equal to a defined critical effect size (CES)[4] for that effect indicator.	Confirmed[5] Low Risk Status/ Threshold and mean/median[6] for the same effect indicator is beyond the baseline (FEIS) normal range[7] (if available) or regional normal range[8] AND Is supported by consistent effects in one or more other study components (i.e., water quality, sediment quality and benthic invertebrates) which links the results to the Project.	To be determined based on outcome of moderate response investigations.

[3] The following endpoints were included or excluded relative to the proposed TARP framework in order to better align the Fish Health and Tissue Chemistry monitoring program with the MDMER EEM program: Fourhorn Sculpin – age (included), length-frequency analysis (excluded).

[4] Definition of a magnitude of change that is indicative of impairment to fish health is based on the critical effect sizes defined by Environment Canada's Metal Mining Effluent Regulations Guidance Document (Environment Canada 2012) and refers to an increase or a decrease in fish health endpoints. Additional critical effect sizes may be defined in the future (i.e., beyond those defined by ECCC).

[5] Confirmed indicates that the Risk Status/ Threshold trigger has been observed in at least two consecutive monitoring programs, whether during the regular monitoring schedule or confirmed through a special study. For fish, the two or more endpoints that triggered the Moderate Risk Status/ Threshold may be in one species (i.e., two endpoints in one species) or two species (i.e., one endpoint in one species, as second endpoint in another species).

[6] The use of the mean or median will depend on the normality of the dataset used to calculate the normal range for each endpoint or tissue chemistry parameter (i.e., if raw or transformed data do not meet the assumptions of normality, the median will be used to provide an estimate of central tendency instead of the mean).

[7] Baseline (FEIS) normal range is based on the FEIS dataset, including operational monitoring data from Milne Inlet and Steensby Inlet, and includes fish length, weight and condition (K).

[8] Regional normal range will be calculated using all available reference area data (i.e., will include annual and ongoing reference area data as it becomes available).

Component	Performance Indicators[3]	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Fish Tissue Chemistry	Primary constituents of Project iron ore: ▪ Aluminum ▪ Magnesium ▪ Iron Metals with the potential to bioaccumulation and biomagnify in the food web: ▪ Mercury ▪ Selenium	A statistically significant difference ($P < 0.1$) in one or more metals concentrations in a sentinel species relative to the reference area, and change is in the direction[9] that indicates impairment to fish health and is of magnitude[10] greater than or equal to the defined CES.	A confirmed[11] Low Risk Status/ Threshold for one or more metals that is also outside the regional normal range[12], and is supported by consistent effects in one or more other study components (i.e., water quality, sediment quality and benthic invertebrates) which links the results to the Project. OR The mean mercury or selenium concentrations (or ≥50% of the individual samples) in Arctic Char tissue chemistry samples are beyond the respective CFIA[13] or BCMOE[14] guidelines.	To be determined based on outcome of moderate response investigations.

CES = critical effect size; FEIS = Final Environmental Impact Statement; CFIA = Canadian Food Inspection Agency; BC MOE = British Columbia Ministry of Environment.

[9] For tissue chemistry, only an increase in concentration will be considered indicative of a toxicological response.

[10] For fish tissue chemistry parameters, the critical effect size is a difference of 100%.

[11] Confirmed indicates that the Action Status/Threshold trigger has been observed in at least two consecutive monitoring programs, whether during the regular monitoring schedule or confirmed through a special study.

[12] Regional normal range is anticipated to include Arctic Char tissue chemistry data from the FEIS (i.e., Milne Inlet and Steensby Inlet) as well as ongoing reference area tissue chemistry data (for *Hiatella arctica* and Fourhorn Sculpin).

[13] Value is 0.5 mg/kg ww total mercury per CFIA (2014) Canadian Food Inspection Agency Fish Products Standards and Methods Manual: Appendix 3 Canadian Guidelines for Chemical Contaminants and Toxins in Fish and Fish Products. Ottawa, ON.

[14] Protection of aquatic life chronic criteria for fish tissue selenium concentrations are 15.1 mg/kg dw for ovary, 8.5 mg/kg dw for whole body, or 11.3 mg/kg dw for skinless, boneless muscle fillet per USEPA (2016) Technical Support for Fish Tissue Monitoring for Implementation of EPA's 2016 Selenium Criterion Draft, EPA 820-F-16-007, United States Environmental Protection Agency, Office of Water.

(e) NIS/AIS

Component	Performance Indicator	Condition Status/Threshold		
		Low Risk	**Moderate Risk**	**High Risk**
NIS/AIS Monitoring Program (integrated in MEEMP)	Occurrence of an NIS/AIS in the Milne Inlet environment	Taxon is not reported as present in Canadian Arctic or there is low certainty as to its presence. OR There is low confidence in the identification (includes species pending verification), where related species are listed in AIS databases and there is potential for survival in the Project area. OR Taxon is undergoing range expansion into Milne Inlet that is attributed to factors or vectors unrelated to Project shipping (e.g., climate change).	Taxon is not reported as present in Canadian Arctic. AND Taxon is capable of using shipping vector(s). AND Taxon is listed as an AIS in other locations. AND Taxon is not yet confirmed to show those behaviours in Milne Inlet.	Taxon is not reported as present in Canadian Arctic. AND Taxon is capable of using shipping vector(s). AND Taxon is listed as an AIS in other locations. AND <u>At least one of the following</u> Taxon or closely related species has well-documented and potentially serious invasive behaviours (e.g., habitat disruption or displacement of native species) in other areas. OR Taxon shows evidence of invasive behaviour in Milne Inlet including but not limited to the species dominating the relative abundance, or reductions in species diversity and richness at sites where the species occurs; competition or predation on native taxa; habitat destruction; and/or dispersal/establishment from site of initial detection.

1.5 Study Design

1.5.1 Study Area

Consistent with previous years, the 2023 MEEMP and NIS/AIS field surveys were conducted primarily within the LSA for the Marine Environment as defined in the FEIS and Addendum 1 (Baffinland 2012; 2013). The LSA includes all of Milne Port (Assomption Harbour) and extends north up to 4 km from the existing terminal (spanning the full width of Milne Inlet at the northern boundary; Figure 1-2). The southeast boundary of the LSA ends at the mouth of Phillips Creek.

In 2019, following feedback provided from MEWG members and the community during 2016 community workshops, additional NIS/AIS and physical oceanographic monitoring was conducted north of the LSA boundary extending to Ragged Island and Eclipse Sound (Figure 1-1). No sampling was conducted at Ragged Island in 2023 due to logistical constraints.

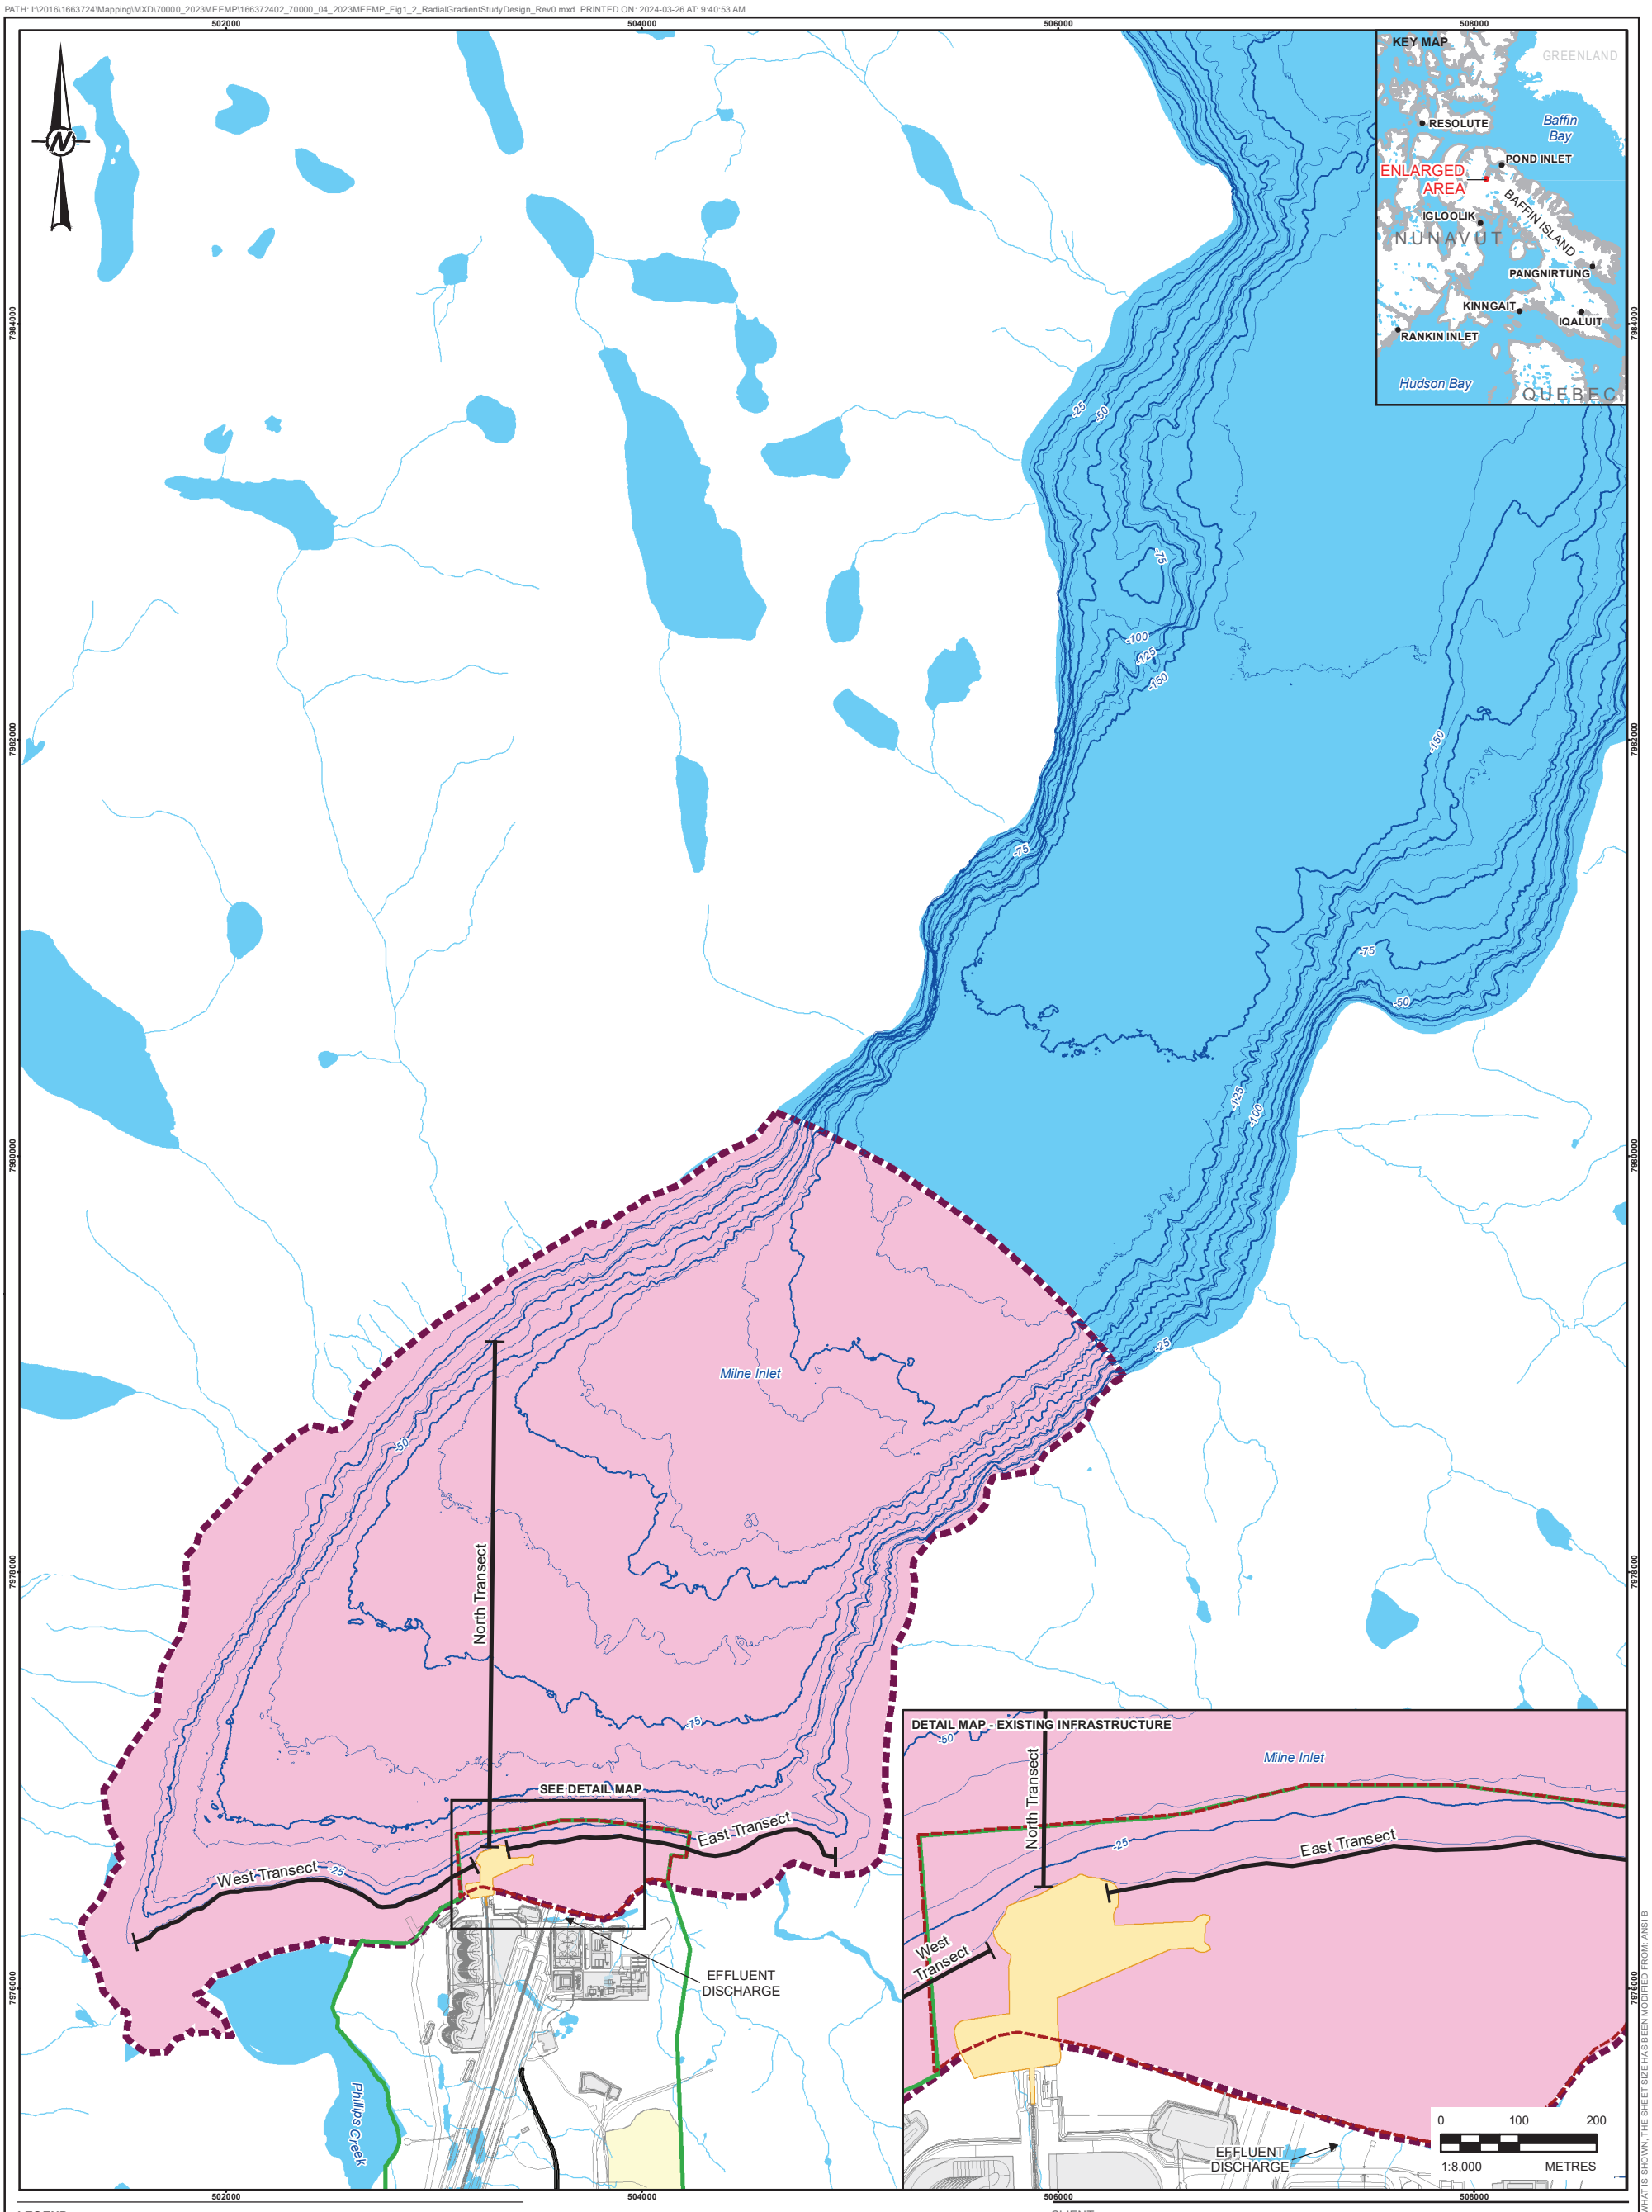
1.5.2 Inuit Participation

Inuit personnel have been integral to the overall success and safe execution of Baffinland's monitoring programs to date. The success of the MEEMP-NIS/AIS program is greatly reliant on local expertise/knowledge and the continued participation of Inuit stakeholders with respect to study design, program implementation, and field logistics. For the 2023 MEEMP program, Inuit participation included field technicians supporting sampling and processing for the various components.

1.5.3 MEEMP

The MEEMP was initially designed in 2015 to evaluate potential Project-related impacts on the marine environment as predicted in the FEIS and subsequent addenda (Baffinland 2013). The original sampling design for the MEEMP (Baffinland 2016; SEM 2015) was based on a radial gradient transect design extending out from the ore dock (Figure 1-2), which represented a potential point source for contaminants (e.g., ore dust, hydrocarbon release, wastewater, and site runoff) and physical perturbations (e.g., sediment re-suspension and transportation). The radial pattern was designed to detect potential Project-related effects based on a gradient of key components with numerical indicators (e.g., metal concentrations in sediment) along a series of transects with increasing distance from the point source.

The initial MEEMP design (excluding NIS/AIS monitoring) comprised the following study components:



- Marine sediment quality
- Benthic epifauna and epiflora dive surveys
- Fish

While the radial gradient design has remained since its original design, the program has been updated to include more components and changes have been made to sampling methodologies and frequencies. Modifications to the MEEMP are summarized below in Section 1.5.3.1. Sampling efforts for the MEEMP in 2023 are summarized in Table 1-5.

Table 1-5: Summary of Sampling Efforts Performed in Milne Port for MEEMP Surveys, 2023

MEEMP Component	Relevant PC Conditions	Collection Methods	Sampling Effort	Sampling Frequency	Years of Data
Marine Water Quality	76, 83 (a), 87, 89 and 99 (a)	Vessel-based using 2.0 L Kemmerer sampling bottles	8 stations	Annually; five sampling events/year	8
Marine Sediment Quality	76, 83(a), 84, 85, 87 and 99(a)	Vessel-based using a Van Veen grab sampler	45 stations	Targeted sampling, full sediment program every three years	10
Benthic Infauna	76, 87, 99(a), 99(c) and 126	Vessel-based using a Van Veen grab sampler	44 stations	Targeted sampling, full benthic infauna program every three years	5
Substrate, Macroflora, & Epifauna	76, 83a, 84, 87, 99 (a) and (c)	Quadrat surveys by SCUBA divers	18 quadrats	Annually	3
Marine Fish Community	99(b)(ii), (c), 113, and 114	Angling	12.1 hours	30 stations	7
		Fukui trap	711.5 hours	14 stations	11
		Gill net	50.9 hours	20 stations	12
		Hoop net	720.6 hours	14 stations	5
		Trawling	1.7 hour	4 stations	4
Fish Health & Tissue Chemistry	76, 83 (a), 87, 99 (a), 99 (b) (ii), 99 (c), 113, and 114.	See above for collection methods. Chemistry analyses completed by specialized laboratories.	22 Arctic Char (Incidental catch)	Annually	13

1.5.3.1 Modifications to the Program

Since program inception, survey design has continually evolved based on refinements identified through consultation with regulatory agencies and Inuit stakeholders, and recommendations made in previous survey years. Table 1-6 summarizes key changes to the program since its inception in 2015.

Table 1-6: Summary of Modifications to the MEEMP Study Design from 2014 to 2023

Year	Component	Description of Modifications
2015	Marine Water Quality	Addition of water quality component to monitor for potential changes associated with site drainage and treated effluent discharges to the marine environment (including iron ore stockpile run-off). Four water quality stations were established near the site discharge point for compliance monitoring; one station next to the site discharge point, and three stations located slightly offshore to the northeast, north and northwest of the source.
2017	Physical Oceanography	Addition of sea level monitoring (using a tidal gauge) and vertical physical profiles of physical oceanographic parameters at Milne Port.
2017/18	Marine Fish Community	In 2017, fish sampling was limited to a two-week period in August, which was not necessarily representative of the entire open-water shipping season (late July to mid-October). In 2018, fish sampling was conducted throughout the duration of the MEEMP program (over four weeks, from the end of July to the end of August) for better representation of the shipping season. Fishing methods included gill netting and Fukui traps, with angling added in 2017, and beach seines added in 2018.
2018	Physical Oceanography	Sea level monitoring was expanded to include physical oceanographic monitoring throughout Milne Inlet including two sites at Milne Port and one at Bruce Head, and additional vertical physical profiles at select times and locations throughout Milne Inlet.
2018	Marine Sediment Quality	The number of sediment samples analyzed for hydrocarbon concentrations was reduced from three samples to one sample at each station, as hydrocarbon concentrations had been below detection limits (DL) in all samples to date. Additionally, two new sediment sampling stations were included along the East Transect to account for anticipated construction associated with the proposed Phase 2 ore dock and freight dock. (The freight dock was subsequently constructed but Phase 2 ore dock is no longer relevant.)
2018	Benthic Infauna	Addition of benthic infaunal sampling program, with input from MEWG. Previous years did not include infaunal sampling but, rather, evaluated changes to the benthic community using epifauna[15] and epiflora[16] as indicators using towed underwater video transect surveys – an approach that did not yield consistent nor reliable data primarily due to issues associated with video resolution.
2018	Epifauna and Epiflora	Study design was changed from one long video transect to a Before - After - Control - Impact (BACI) approach with five belt transects (1 m x 5 m plots) permanently installed on the seabed in each of the exposure and reference areas; monitoring was conducted using a remotely operated vehicle (ROV) underwater video system.

[15] benthic invertebrates living on the substrate

[16] marine vegetation attached to the substrate (e.g. kelp)

Year	Component	Description of Modifications
2018	Fish Health & Tissue Chemistry	Addition of local shellfish species, wrinkled rock-borer (*Hiatella arctica)*, as an additional effects indicator in the event finfish species (Arctic Char or sculpins) were sampled in insufficient numbers to adequately support statistical analyses. Measurement endpoints included body weight to length ratio and tissue (body burden) analysis. Prior to 2018, fish tissue sampling was limited to incidental Arctic Char mortalities, which fluctuated from year to year and did not always yield enough samples for a meaningful statistical analysis.
2019	Physical Oceanography	Vertical physical profiles of water quality parameters including temperature, salinity, conductivity, turbidity, pH, chlorophyll-a, and dissolved oxygen were taken north of Ragged Island in Eclipse Sound in August and September 2019.
2019	Benthic Infauna/ Marine Sediment Quality	Following the results of a power analysis, sampling intensity for benthic infauna and marine sediment was increased from four transects with five stations, to five transects with 15 stations each to improve statistical power and the ability to detect Project-related effects. Unlike in previous years, separate NIS/AIS stations were not sampled due to the expansion of the benthic sampling program.
2019	Benthic Infauna	In previous years, three replicate grab samples were taken at each benthic infauna sampling station. In 2019, the three grab samples were composited into a single sample for each station.
2019	Fish Health & Tissue Chemistry	Inclusion of sculpin (*Myoxocephalus* sp.) as a sentinel species and effects indicator due to the number of incidental mortalities being sufficient to support analyses.
2019	Fish Health & Tissue Chemistry	Instead of collecting length and weight measurements of *Hiatella arctica* samples in the field, *Hiatella arctica* specimens were submitted for age analysis in addition to the tissue (body burden) analysis.
2019	Marine Fish Community	Hoop nets were introduced to the fish sampling program to determine the capture efficiency of the method in Milne Port and to assess its potential as a replacement for Fukui trapping. Fukui traps will continue to be used in addition to hoop nets to meet commitments of continuing to sample at old locations for a minimum of three years (2022 was year 3) to facilitate comparison of old and new methods/results.
2020	Marine Water Quality	Addition of a second water quality monitoring station at the discharge location of MP-06, consistent with the study design for the existing water quality monitoring station at the discharge location for MP-05.
2020	Marine Water Quality	The collection of water samples was scheduled to coincide with at least one active discharge event at each discharge. One collection event also coincided with a de-ballasting event along the Ore Dock.
2020	Marine Sediment Quality/Benthic Infauna	Following time constraints in 2019, the sampling effort was increased from eight to ten sampling stations per transect to 15 sampling stations per transect.
2020	Marine Sediment Quality/Benthic Infauna	Benthic infauna and sediment sampling methodology and equipment was standardized across all stations to ensure consistency and comparability of results.
2020	Marine Sediment Quality/Benthic Infauna	The Coastal Transect was removed from the sampling plan after being determined as not contributing to the radial gradient design of the sediment and benthic sampling components.
2020	Substrate, Macroflora, and Benthic Epifauna	Due to the previously deployed belt transects being moved, twisted, and obscured following a short deployment period, the belt transects were replaced with ten steel quadrats that should be more robust under the local conditions.

Year	Component	Description of Modifications
2020	Substrate, Macroflora, and Benthic Epifauna	Following limitations in species identification in Remotely Operated Vehicle (ROV) footage on the belt transects, a dive team trained in the identification of marine biota were used in addition to ROV for survey of the quadrats.
2020	Marine Fish Community	Based on input and recommendations by Inuit field personnel, fishing locations were selected, and modifications were made to the methodologies for Fukui traps and hoop nets. Modifications included setting the traps in deeper locations to target demersal species and improve capture efficiency.
2020	Fish Health and Tissue Chemistry	Fourhorn Sculpin (*Myoxocephalus quadricornis*) were added as a targeted species for fish health and tissue chemistry/body burden analysis to monitor for impacts to resident fish species in Milne Port.
2020	Fish Health and Tissue Chemistry	Additional indicators were added to the fish health program to align with a Metal and Diamond Mining Effluent Regulations (MDMER) Environmental Effects Monitoring (EEM) program design. This included the addition of targeted lethal fish sampling to meet a minimum sample size.
2021/22	Marine Sediment Quality/Benthic Infauna	Monitoring frequency for the joint radial sediment and benthic sampling program has been adjusted to every three years, consistent with routine biological sampling for other mining effects monitoring programs and reflective of federal guidance (e.g., the federal Environmental Effects Monitoring Program [EEM]). Targeted sampling at SW-2 and in 2022, additional sampling at adjacent stations SW-1, SW-3 and SW-4.
2021	Substrate, Macroflora, and Benthic Epifauna	Ten additional quadrats were fabricated and deployed: five in each the reference and impact areas. ROV methods were replaced by exclusive use of divers to improve taxonomic resolution of the data. 2021 was the first year that opportunistic samples of macroflora and epifauna were collected for taxonomic/genetic identification.
2021	Marine Fish Community	Longlines were trialed as a fishing method to the 2021 program. In addition, two Fishing Areas were delineated based on habitat features and their location relative to Milne Port to help standardize sampling efforts and address variability in the catch data across Milne Port.
2022	Marine Water Quality	The outfall location of MP-05 was moved to a more westward position along the beach between the Ore Dock and the Freight Dock. The coordinates for Source-1 sample location were adjusted to reflect the new position.
2022	Substrate, Macroflora, and Benthic Epifauna	Six additional quadrats were fabricated and deployed: three in each the reference and impact areas.
2022	Marine Fish Community	Following an unsuccessful trial of longlines in 2021, the method was discontinued.
2022	Marine Fish Community	Catch per unit effort (CPUE) calculations were revised for two fishing methods (hoop nets and Fukui traps) to better account for field variability. Data from 2020 and 2021 were re-calculated with the modified CPUE calculations and compared against 2022 results.
2022	Marine Fish Community	A reconnaissance for a potential reference area was performed in two locations north of Milne Port. Water quality, sediment quality and fish community sampling were completed as part of the reconnaissance survey.
2023	Marine Sediment Quality	Addition of two stations (SCV-1, SCV-2) for monitoring impacts of Baby Cape and Capesize ore vessels.
2023	Benthic Infauna	Addition of three stations (SE18-1, SCV-1, SCV-2) for monitoring impacts of Baby Cape and Capesize ore vessels. SE18-1 was formerly sampled for sediment only.
2023	Physical Oceanography	Tidal gauge monitoring was not conducted, pending review of methodology.

1.5.4 NIS/AIS Monitoring

The NIS/AIS monitoring program was designed to detect for the potential introduction of non-native species from ballast water discharges and/or hull biofouling and is focused in areas with the highest likelihood of marine invasion. Due to ballast water releases occurring in Milne Port, NIS/AIS sampling largely focuses on southern Milne Inlet. The NIS/AIS Monitoring Program is conducted at a surveillance level, where detection of a single Project-related invasive species is the threshold for triggering of adaptive management measures (e.g., species rapid response plans) and/or potential corrective actions (e.g., measures to contain or eradicate the NIS/AIS), if deemed feasible. The NIS/AIS monitoring program consisted of data collected across multiple trophic levels (marine vegetation, benthic invertebrates, and fish) to establish a comprehensive inventory of existing marine biota in the Project area that is intended to serve as a point of reference for any new species identified over time, and to evaluate potential changes in community structure that may be linked to NIS/AIS introductions. Sampling efforts that contribute to the NIS/AIS monitoring program are summarized in Table 1-7. NIS/AIS monitoring is recommended to be conducted annually.

Table 1-7: Summary of Sampling Efforts Performed in Milne Port for NIS/AIS Monitoring Program Surveys, 2023

Relevant PC Conditions	Collection Methods	Sampling Effort in 2023	Sampling Frequency	Years of Data
76, 87, 89, 91, 99 (a), and 99 (c)	Permanent Quadrats	18 Quadrats	Annual	6[1]
	Active Fish Sampling	82 Stations	Repetitive, Annually	12
	Fish Stomach Contents	51 Fish	Repetitive, Opportunistic, Annually	11
	Benthic Infauna	44 Stations	Annual	12
	Settlement Substrates	42 Plates 38 Baskets	Annual	5[2]
	Zooplankton	12 Stations	Repetitive, Annually	11[3]
	Incidental Specimen Collection	N/A	Opportunistic, Annually	5

[1]Includes sampling of belt transects which were used from 2017-2018 exclusively for NIS/AIS surveys until they were replaced by permanent quadrats and added to MEEMP surveys.

[2]Settlement substrates were first deployed in 2014, however they were only successfully retrieved for analysis in 2018 and 2019. A new design was successfully implemented in 2020, with collections beginning in 2021.

[3]Zooplankton sampling did not occur in 2021.

1.5.4.1 Modifications to the Program

The initial NIS/AIS surveys were conducted in 2014 to enhance marine flora and fauna inventories collected during baseline sampling in 2008 and 2013. In subsequent years, NIS/AIS monitoring focused on identification of organisms not previously detected during the baseline program (as primary indicators of invasion). Equivalent NIS/AIS monitoring was continued in Milne Port area, although the program was expanded and modified based on refinements identified through consultation with regulatory agencies and Inuit stakeholders and recommendations made in previous survey years. Table 1-8 summarizes key changes to the program.

Table 1-8: Summary of Modifications to the NIS/AIS Monitoring Program Study Design from 2015 to 2023

Year	Program Component	Description of Modification
2015	Settlement Baskets	Baskets were redeployed instead of being collected for annual analysis due to insufficient colonization on the substrate.
2016	Settlement Baskets	New settlement baskets were deployed in Milne Port to replace sets previously lost.
2017	Benthic Infauna and Zooplankton	Four new sampling locations were added at Ragged Island to sample specifically for the NIS/AIS monitoring program in response to public concern over ships potentially discharging ballast water while occupying anchorage sites in this area.
2017	Zooplankton	Four new sampling locations were established in Milne Port for vertical zooplankton hauls, and two new locations for oblique zooplankton tows.
2017	Zooplankton	Modifications to the methodology for oblique zooplankton tows were made to target faster moving species and increase the total number of species identified.
2018	ROV Surveys	ROV-based surveys were made along the hulls of several ore carriers to assess for potential biofouling on vessels originating from outside of Canadian waters.
2019	Benthic Infauna	In 2019, no benthic infauna sampling occurred at the original NIS/AIS specific stations, due to the significant expansion of the benthic sampling program. A greater number of stations were sampled for identification of benthic infauna. NIS/AIS status was determined for all infauna identified in benthic sampling.
2019	Macroflora and Epifauna	A new NIS/AIS towed video survey transect was added east of the new Freight Dock at Milne Port to account for potential changes in shipping rates in Milne Port.
2019	Zooplankton	Two oblique zooplankton tow sampling locations were added to the Ragged Island component.
2020	Overall Program	The program name was changed from AIS Monitoring to NIS/AIS monitoring to emphasize efforts to monitor for all potential species introductions to Milne Port, regardless of invasive status.
2020	ROV Surveys	Survey methodology was reviewed with the operator to ensure the methodology was aligned with the stratified survey design used in Sylvester and MacIsaac (2010).
2020	Ship Hull Monitoring	Performed ROV-based ship hull monitoring on two ships at anchorage to avoid limitations with hull visibility and accessibility when ships are moored at the Ore Dock, increasing the total area and survey time for each ship.
2020	Settlement Baskets	Deployment of nine new sets of settlement baskets and plates along the Freight Dock, as well as ten sets of settlement plates in other locations around Milne Port to increase monitoring of recruitment of encrusting biota.
2020	DNA Sampling	To improve taxonomic resolution, a DNA sampling component was added. Targeted sampling occurred at locations where potential NIS/AIS taxa had been observed previously, samples were preserved for DNA analysis at the Canadian Centre for DNA Barcoding at the University of Guelph. Incidentally-collected specimens were also selectively preserved for barcoding and taxonomic confirmation.
2021	Zooplankton	Zooplankton tows were removed from the sampling program due to the high variability in the data and limited sampling not capturing the seasonal presence of many taxa.
2021	Settlement Baskets	Deployment of new sets of settlement plates and baskets co-located with new quadrats around Milne Port to increase monitoring of recruitment of encrusting biota.
2021	Ship Hull Monitoring	Monitoring of ship hulls was not conducted in 2021 as Baffinland works with DFO to design a methodology that will improve the taxonomic resolution of the data collected to better inform assessment of NIS/AIS risk

Year	Program Component	Description of Modification
2022	Benthic Infauna	Samples were collected at 12 additional benthic infauna stations (for a total of 16) to continue monitoring for NIS/AIS during reduced sampling years for MEEMP surveys.
2022	DNA Sampling	Following targeted sampling in 2020 and 2021 to obtain specimens for genetic analysis, no additional locations were identified for potential flagged taxa. As a result, no targeted sampling for genetic analysis occurred in 2022. Rather, the subfractions remaining following analysis of samples collected for genetic analysis in 2021 will be sorted for targeted organisms.
2022	Zooplankton	Zooplankton sampling at 12 stations was completed, following removal from the program in 2021.
2022	Reporting	Standardized distribution and uncertainty categories have been created and defined to better express confidence in range assessments for new taxa observations.
2022	Reporting	Reports will be submitted to NIRB in final form, with responses to MEWG comments addressed in subsequent annual report,
2023	Macroalgae	A new collaboration was started with the University of New Brunswick to improve taxonomic resolution of macroalgae identification through DNA analysis.
2023	Zooplankton	Zooplankton sampling program was expanded for better seasonal coverage. Twelve stations were sampled on three dates. Compared to a single sample event in previous years.

1.6 Conclusions and Recommendations

The MEEMP-NIS/AIS program has been designed to meet the objectives of the various conditions associated with Project Certificate 005, as well as to evaluate whether Project activities have potentially impacted the marine environment over time. Predictions from the FEIS and subsequent addenda (Baffinland 2012; 2013) indicated the potential for low magnitude changes in some ecological parameters, such as water quality and Arctic Char tissue chemistry, but characterized these as “not significant”. Overall, monitoring data align with these predictions, as observed changes are typically minor and either within established guidelines or consistent with baseline levels. Thus, monitoring to date suggests that mitigation measures are functioning as intended and that Project activities are being managed in a way that has not adversely affected the marine ecosystem.

The main conclusions and recommendations based on the results of the 2023 MEEMP-NIS/AIS studies are as follows:

- **Marine Water Quality**
  - Relevant to PC No. 76, 83(a), 87, 89, 99(a).
  - Measured concentrations of metals were generally consistent with previous years and remained below CCME water quality guidelines for the protection of aquatic life while hydrocarbons and PAHs were not detected at all.
  - Laboratory analyses have not revealed a clear increase in the concentrations of iron in water samples collected between 2017 and 2022; iron was within the 2015-2022 range of detected concentrations.
  - Monitoring results remained within original FEIS predictions, which forecasted no significant residual effects on water quality but indicated the potential for minor localized increases in TSS, nutrient, metal, and hydrocarbon concentrations.

- The ‘Low Risk’ threshold for TARP was not triggered in 2023 because the 30-day mean for each water quality indicator was less the 75% of the applicable CCME water quality guideline for the protection of aquatic life, and iron did not show a spatial pattern or a temporal trend indicative of effects from the Port’s effluent discharge.
- **It is recommended that the water quality sampling program continue in 2024 to ensure compliance with Project requirements and that parameters of potential concern remain well below thresholds of harm for marine biota.**

- **Marine Sediment Quality**
  - Relevant to PC No. 76, 83(a), 84, 85, 87, and 99(a).
  - Sediment quality was consistent with previous MEEMP years:
    - Concentrations of metals and hydrocarbons continued to be below applicable CCME sediment quality guidelines, and the data do not suggest Project-related impacts.
    - Sediment grain size measurements indicated the stations were dominated by sand with varying, but low, proportions of fines content over time. It is expected that sediment results will show high spatial and temporal variability in fines content – driven by natural factors, such as ice movement and coastal sediment processes, as well potential influences of vessel propeller wash.
  - Monitoring results remained within original FEIS predictions, which forecasted the potential for minor and localized sediment disturbance associated with propeller wash, which is expected to stabilize over time.
  - The ‘Low Risk’ threshold was not triggered in 2023 because the sediment quality indicators present at concentrations in 2023 lower than the ISQG. Where isolated ISQG exceedances did occur, sediment concentrations were within expected background concentrations as informed by pre-project baseline studies.
  - **It is recommended to continue sampling of these stations in 2024 to further increase understanding of sediment grain size variability and to monitor for potential effects of Project activities on grain size distribution.**
- **Benthic Infauna**
  - Relevant to PC No. 76, 87, 99(a), 99(c), and 126.
  - Overall, the results indicated that benthic communities in Milne Port remained healthy and diverse.
  - To date, station SW-2 in 2020 was the only instance where reduced fines content was accompanied by a substantial reduction in benthic density, richness and diversity. Data collected from 2021 through 2023 generally indicate that the benthic community at that station have since recovered, and that the effects were temporary and localized.
  - Monitoring results remained within original FEIS predictions, which forecasted the potential for minor and localized sediment disturbance associated with propeller wash and associated short-term effects on benthic infaunal invertebrate community indicators.

- The ‘Low Risk’ threshold was not triggered in 2023 because the spatial and temporal trend analysis for density and taxa richness did not suggest a pattern indicative of Port-related effects beyond FEIS predictions, and the low risk status/threshold was not triggered for sediment quality.
- **It is recommended to continue sampling of these stations in 2024 and will further increase understanding of benthic infauna community variability and monitor for potential effects of Project activities.**

- **Substrate, Macroflora, and Benthic Epifauna**
  - Relevant to PC No. 76, 83(a), 84, 87, 99(a), and 99(c).
  - Overall, macrofloral and benthic epifaunal community assemblages were comparable between exposure and reference areas but varied interannually for some assemblage indicators which were likely driven by environmental factors. Monitoring efforts to date revealed no evidence of overarching spatial or temporal trends that might be associated with Project-induced effects from construction or operation activities and Milne Port.
  - **It is recommended that monitoring of macrofloral and benthic epifaunal assemblages should continue using the same sampling and statistical design. Additionally, it is recommended to increase collections of unknown taxa, where possible, for identification. Such taxa should be collected outside the permanent quadrats, where possible, to minimize impacts on community composition within the quadrats.**
- **Marine Fish Community**
  - Relevant to PC No. 99(b)(ii), (c), 113, and 114.
  - Monitoring efforts to date revealed no evidence of overarching spatial or temporal trends that might be associated with adverse Project-induced effects from construction or operation of Milne Port.
  - Overall, fishing methods were deemed effective in characterizing the marine fish community in terms of species presence and relative abundance.
  - The delineation of fishing areas (Direct Project Footprint and Indirect Project Footprint) and standardization of fishing methods provides a rigorous study design for generating catch statistics that can be compared for assessing trends in the abundance and distribution of fish at Milne Port into the future.
  - Monitoring results aligned with predictions of the FEIS and subsequent addenda, which forecasted that the Project would have no significant effects on marine fish habitat, nor would it significantly affect Arctic Char populations.
  - **As power analyses continue to indicate the power of statistical comparison was relatively low, it is recommended that angling-trolling and Fukui traps be removed as fishing methods so that sampling can focus on increasing the number of efforts for angling-jigging, gill nets, and hoop nets for improved statistical power. Trawling would be retained in the program as a contributor to understanding fish diversity in Milne Port, but this sampling technique is not expected to meet a statistical effect size target.**

- **Fish Health and Tissue Chemistry**
  - Relevant to PC No. 76, 83 (a), 87, 99 (a), 113, and 114.
  - Monitoring results remained well within predictions of the FEIS and subsequent addenda (Baffinland 2012; 2013), which indicated the potential for non-significant, low magnitude effects on Arctic Char health and body condition that are expected to be reversible. Observed changes have generally been small and either within established guidelines, or consistent with baseline conditions, and are thus considered to reflect natural variability rather than effects potentially resulting from the Project.
  - In 2023, one fish health endpoint in Fourhorn Sculpin exceeded the 'Low Risk' threshold. Female Fourhorn Sculpin relative gonad weight was significantly different between Milne Port and Koluktoo Bay, and the associated effect size (-31%) exceeded the CES (±25%) in a direction indicative of an impairment to fish health. No additional endpoints for Fourhorn Sculpin and none of the fish health endpoints for *H. arctica* exceeded TARP thresholds.
  - No fish tissue chemistry endpoints exceeded TARP thresholds in 2023.
  - **Continued monitoring is recommended to maintain continuity in established time series data for Arctic Char and the collection of additional fish health and tissue chemistry for Fourhorn Sculpin and *Hiatella arctica,* to provide an ongoing dataset for use in monitoring efforts for both species into the future.**
- **NIS/AIS Monitoring Program**
  - Relevant to PC No. 76, 87, 89, 91, 99 (a), and 99 (c).
  - To date, 1,062 taxa have been documented in Milne Inlet to date, the vast majority of which are not NIS/AIS.
  - Taxa identified in 2023 surveys included 31 taxa not previously collected during Project monitoring in Milne Port. All new taxa had records of occurrence in the Canadian Arctic, or described ranges that were likely to include the Project area. Results remain pending for macroflora identifications as well as genetic analysis of macroflora and animal taxa.
  - Additionally, NIS/AIS monitoring in 2023 collected five taxa that were placed on the Watch List in previous years due to uncertainties in their natural range or because they were listed in an existing AIS database. Specimens of *Hesperonoe* sp. were sent to taxonomic experts for taxonomic verification.
  - No new taxa were added to the Watch List in 2023, while one taxon (*Sosane wireni*) was removed due to records indicating a probable range that extends to the Eastern Canadian Arctic. Following this change, the Watch List consists of eight taxa.
  - There are currently no taxa on the Trigger List.
  - No NIS/AIS endpoint exceeded TARP "Low Risk" thresholds in 2023.
  - **It is recommended to continue the following:**
    - **sampling across multiple trophic levels continue in 2024 and continuing to expand the Milne Inlet Taxonomic Inventory**
    - **using external accredited laboratories and/or global specialists to confirm identifications of specimens requiring a more in-depth taxonomic analysis.**
    - **collecting targeted samples for DNA analysis at locations where high-risk taxa have previously been observed.**

Further details on each component of the MEEMP-NIS/AIS program are provided in topic specific chapters: Marine Water Quality (Chapter 2.0); Marine Sediment Quality (Chapter 3.0); Benthic Infauna (Chapter 4.0); Substrate, Macroflora, and Benthic Epifauna (Chapter 5.0); Marine Fish Community Program (Chapter 6.0); Fish Health and Tissue Chemistry (Chapter 7.0); and NIS/AIS Monitoring Program (Chapter 8.0).

Comments on the 2023 MEEMP and NIS/AIS Monitoring Program Report are anticipated to be received from the Marine Environmental Working Group (MEWG) in June of 2024. Baffinland's responses to MEWG comments and recommendations on the final report will be circulated to the MEWG as a standalone document and included as Appendix A in the subsequent year's NIRB Annual Report (2025).

2.0 WATER QUALITY

2.1 Introduction

This chapter presents the results of the marine water quality monitoring program, a component of the larger Marine Environmental Effects Monitoring Program (MEEMP) conducted at Milne Port and in Milne Inlet during the 2023 open-water season. The water quality component was developed in consideration of the potential Project-related impacts to the marine environment as predicted in the Final Environmental Impact Statement (FEIS) and FEIS addenda (Baffinland 2012, 2013), as well as monitoring requirements outlined in the Project Certificate (PC) Conditions described in Chapter 1.0, Table 1-2 (i.e., PC Conditions No. 76, 83(a), 87, 89 and 99(a)), and as required by the Type A Water License.

2.1.1 Objectives

The MEEMP objectives are outlined in Section 1.3 for the overall program. The objective specific to the marine water quality component is:

- Assess potential changes in marine water quality parameters in the receiving environment related to site drainage and effluent discharges at MP-05 and MP-06.

2.2 Study Design

2.2.1 Sampling Parameters

The marine water quality program is designed to monitor potential changes in receiving environment water quality associated with site drainage and effluent from two discharge points (MP-05 and MP-06), including run-off from the iron ore stockpiles. The MP-05 discharge is permitted from the Milne Port Ore Stockpile Sedimentation Pond (East) and the MP-06 discharge is permitted from the Milne Port Ore Stockpile Sedimentation Pond (West). The quality of both effluent discharges is monitored monthly during each intermittent discharge period by the Mine as per the requirements of the Type “A”, Water Licence No. 2AM-MRY1325, and reported elsewhere. The marine receiving environment for the MP-05 primary discharge has been monitored annually since 2015, with monitoring at a second discharge point (MP-06) added in 2020. This sampling program has been applied to identify and characterize adverse effects on marine water quality in Milne Port from the two site discharges, to evaluate the current effectiveness of existing mitigation measures, and to inform the need for further mitigation and/or alterations to Project activities, as necessary.

In 2023, water quality samples were collected at four sampling stations near the primary site discharge (MP-05) that have been monitored annually from 2015 to 2022[1]. One station is situated downstream from the marine discharge point for effluent and collected site drainage (i.e., Source-1), while the remaining three stations are located approximately 250 m offshore from the outfall location to the northwest (WNE-1), north (North-1), and northeast (ENE-1), respectively (Figure 2-1, Table 2-1). The same sampling plan was applied to MP-06 in 2020 and so four water quality stations were monitored in 2023 downstream from the discharge (Source-2) and approximately 250 m offshore in different directions (WNE-2, North-2, ENE-2) (Figure 2-1, Table 2-1). As indicated in Table 2-1, due to the repositioning of the MP-05 discharge point, sampling points N-1 and ENE-1

[1] SEM 2016; SEM 2017; Golder 2018, Golder 2019, Golder 2020, Golder 2021, Golder 2022; WSP 2023

were adjusted to be approximately 250 m from the MP-05 discharge point. The new coordinates for the locations are in (Table 2-1), and the locations are mapped in Figure 2-1. The WNW-1 location has remained the same as previous sampling years due to the position of the jetty. These modifications did not affect the relevance of the data to address study objectives, or the reliability of the water quality data collected. The new coordinates for the locations are in Table 2-1 and the locations are mapped in Figure 2-1. Similar to previous years, efforts were made to collect water quality samples during active effluent discharge periods, given that site effluent discharges were intermittent during the 2023 open-water season.

Table 2-1: 2023 Marine Water Quality Sampling Locations at MP-05 and MP-06

Site Discharge Location	Station Name	UTM Coordinates (17W)	
		Easting (m)	Northing (m)
MP-05 (Milne Port Ore Stockpile Sedimentation Pond [East])	Source-1 [a]	503510	7976481
	West Northwest (WNW) - 1	503540	7976599
	North (N) – 1	503615	7976655
	East Northeast (ENE) – 1 [b]	503727	7976510
MP-06 (Milne Port Ore Stockpile Sedimentation Pond [West])	Source-2	503044	7976445
	WNW-2	502828	7976474
	N-2	502943	7976619
	ENE-2	503114	7976665

Notes: UTM = Universal Transverse Mercator; m = meter.

The discharge point for MP-05 in 2023 was moved to be approximately 20 m north of the pond at UTM coordinates 17W 0503483 7976447 (P. Tomliens personal communication to C. Pettem, 14 June 2023).

[a] – On 11 August 2023 the MP-05 discharge was moved approximately 100 m west of where it was originally. The Source-1 sampling event was conducted at UTM coordinates 17W 503430 7976481. This, along with the 2023 MP-05 discharge relocation, are not expected to influence historical comparisons.

[b] – On 15 August 2023 MP05-ENE was moved approximately 70 m west to 17W 0503653 7976508 due to a fuel line obstructing the sampling station and wind/weather.

2.2.2 Indicators and Thresholds

Indicators and thresholds selected for the MEEMP program are described in Section 1.4.2. For marine water quality, a number of parameters are measured, including physical parameters, nutrients, metals, and hydrocarbons. A subset of these parameters (i.e., metals, total suspended solids [TSS], nutrients, and hydrocarbons) are identified as performance indicators to assess potential effects of effluent discharge on the receiving environment. To provide early warning of environmental effects from the Project, applicable water quality guidelines (WQGs) are used as a threshold where these exist (i.e., Canadian Council of Ministers of the Environment [CCME] WQGs for the protection of aquatic life in marine environments [CCME 2023]). For indicators with no associated WQG, such as iron, concentrations were compared to the data range from previous years (2015-2022). If a guideline exceedance was seen, or where no guideline exists, there was an increasing trend over time, then the effluent data from the discharge were reviewed to determine if the observed increase in these parameters was related to effluent discharges from MP-05 and MP-06.

Along with several other components of the MEEMP, the marine water quality monitoring program has indicators, thresholds and risk categories that are part of Baffinland's Trigger Action Response Plan (TARP), an adaptive management process. The TARP uses effect indicators that are measured against a series of tiered thresholds (i.e., low, moderate and high-risk thresholds) that are designed to guide short-term and long-term adaptive management strategies as outlined in Baffinland (2024). Baffinland has updated the TARP as part of the revised draft Marine Monitoring Plan (Baffinland 2023). The pre-defined actions identified in the TARP describe the responses that Baffinland would implement should the corresponding threshold levels be exceeded and assuming there is some degree of certainty that the measured change is Project-related. As adaptive management is beyond the scope of the present report, only the indicators, risk categories and thresholds are presented here (section 2.3.4).

2.3 Materials and Methods

2.3.1 Field Methodology

Water quality samples were collected during five sampling events scheduled between 4 and 23 August 2023 to monitor for potential changes in water quality associated with site drainage and effluent discharges to the marine environment (including iron ore stockpile run-off). Samples were typically collected every few days over this period; however, some flexibility was built into the sampling program to facilitate the collection of effluent and receiving water quality samples from the same discharge period to allow for direct comparisons.

Water samples were collected from just below the surface (1 to 2 m) or mid-water column depth from the deeper sample MP-06 locations (MP-06-WNW, MP-06-North, and MP-06-ENE) from a zodiac vessel using a 2.0 L vertically oriented Kemmerer bottle sampler. The sampler was washed with laboratory-grade detergent and then rinsed with site-water prior to sample collection at each station. Samples were preserved in the field according to laboratory instructions and kept refrigerated until they were shipped (within 48 h of sample collection) on ice in coolers to ALS Canada Ltd. (ALS), a Canadian Association for Laboratory Accreditation Inc. (CALA) accredited analytical laboratory. To further limit the time between sample collection and preservation, dissolved metals and mercury samples were field-filtered and preserved, rather than being filtered by the analytical laboratory upon sample receipt. Samples were analyzed for routine parameters, TSS, nutrients, major ions, total and dissolved metals (including mercury), benzene, toluene, ethylbenzene, xylenes, hydrocarbons, and PAHs. At each sampling station, in situ water quality measurements were conducted using a YSI multiparameter meter. Instrumentation was deployed once per station at the same depth as the discrete water quality sample to collect measurements of conductivity, temperature, depth, dissolved oxygen, turbidity, and pH. A full list of field water quality parameters is provided in Appendix 2A in the field data sheets, while a full chemistry parameter list is provided in the analytical reports in Appendix 2B. A total of three field duplicates and three field blank quality control (QC) samples were collected during the field program for Quality Assurance / Quality Control (QA/QC) purposes as discussed in Section 2.3.3.

The frequency of sampling for hydrocarbons (Petroleum hydrocarbons [BTEX/F1]; Hydrocarbons [LEPH/HEPH], F2-F4, Polycyclic Aromatic Hydrocarbons [PAHs]) in 2023 was consistent with the 2021 and 2022 sampling programs. Organic constituents have not been detected in water samples collected since 2015. As such, for each of the five sampling events, hydrocarbons were sampled at two of the four receiving environment stations established for each of the two discharges, for a total of twenty samples.

2.3.2 Data Analysis

Descriptive summary statistics (i.e., mean, minimum, maximum) were calculated for each sampling station over the five sampling events. For statistical calculations, the value of the reported detection limit (DL)[2] was conservatively used for measurements reported to be below the DL. The 2023 summary statistics were screened against the CCME WQGs for the protection of aquatic life in marine environments (CCME 2021). For parameters of interest without an applicable CCME WQG (e.g., iron), concentrations were qualitatively compared to the range of water concentrations reported in previous years (i.e., annually from 2015 to 2022). A point to note, analytical improvements in the ability to detect iron were made in 2017, which reduced the detection limit to <10 µg/L from

[2] The lowest concentration at which individual measurement results for a specific analyte are statistically different from a blank (that may be zero) with a specified confidence level for a given method and representative matrix.

the DL of 500 µg/L reported in the 2015 and 2016 MEEMP programs. Differences in the sensitivity of DL precludes comparison of the 2023 iron data to pre-2017 iron data.

The application of CCME WQGs to total concentrations measured in the environment can be conservative, especially when those metals are part of the mineral matrix that makes up the particle. This is because total metal concentrations reflect both the proportion of metals associated with particles as well as dissolved in the water column. Dissolved concentrations[3] tend to provide a more realistic indication of the bioavailable concentration for direct uptake from the water, particularly in turbid receiving environments (Chapman and Wang 2000); however, water quality guidelines for the protection of aquatic life are generally based on total (not dissolved) concentrations. WQGs are derived from laboratory-based toxicity tests where exposure concentrations are based on metals in solution from metal salts and the laboratory test water has a low level of suspended matter (i.e., clear water). Typically, these toxicity tests involve exposure of test fish, invertebrate, or plant species to more bioavailable dissolved metal concentrations, whereas the exposure guideline is based on total concentrations, thus contributing to conservatism in the derivation of water quality guidelines.

Baffinland was responsible for summarizing the 2023 effluent data from MP-05 and MP-06 as per the Type A Water Licence requirements and results are reported by Baffinland separately.

2.3.2.1 Analysis of Temporal Trends of Iron Concentrations

The analysis of iron concentrations was performed separately for MP-05 and MP-06 data. For MP-05, where seven years of data were available, the temporal trend was analyzed using year as a continuous variable. The variable was modeled as a natural cubic spline with three degrees of freedom, to account for the non-linearity in temporal trends in fines. For MP-06, where only four years of data were available, the temporal trend was analyzed using year as a categorical variable. For both analyses, the models included three fixed effects – the main effects of year and site, and the interaction between year and site. In addition, a random effect of date (as a categorical variable) was used to account for variability between sampling days.

Both analyses were conducted using beta regressions using the package glmmTMB (Brooks et al. 2017) in the statistical package R v. 4.3.2 (R 2023). Following both regressions, if the interaction between year and site, or the main effect of site were significant, multiple comparisons between years within each site were performed using the package emmeans (Lenth 2020).

2.3.3 Quality Management

Consistent application of quality assurance/quality control (QA/QC) measures facilitates the collection of high-quality data which, in turn, increases confidence in the robustness of results. Quality management procedures were applied to the field collection, data analysis, and reporting tasks for the water quality program to verify that the data presented are valid and of acceptable quality to address MEEMP objectives.

[3] The measure of “dissolved” metals is an operational definition based on whether the metal passes through a small (0.45 micrometre [µm]) filter (BC MWLAP 2013)

2.3.3.1 Field QA/QC

Field staff were trained to be proficient in standardized sampling procedures, data recording using standard forms, and equipment operations applicable to the monitoring program. Field work was conducted according to specified instructions and established technical procedures for standard sample collection, preservation, handling, storage, and shipping procedures.

General QA/QC tasks applicable to the water quality program included, but were not limited to, the following:

- Preparing geo-referenced field maps for use during the program to accurately document sampling locations and project-specific data collection forms to standardize the field data collection process.
- Regular communications between the Project Manager and field staff.
- Collection of Quality Control (QC) samples in the field (field duplicates and blanks).
- Accredited laboratories were selected for sample analysis and the performance quality of these laboratories was verified through WSP's internal vendor approval and assessment procedures.
- Field data sheets were reviewed by the field supervisor at the end of each day for completeness and accuracy.
- Chain-of-custody documentation was used to track sample shipments to the individual subcontractor laboratories.
- Samples were packaged and shipped to the laboratory in accordance with required holding times and storage conditions.

Field blanks were collected to identify potential sources of contamination during field sampling. Field blank sample containers were filled with de-ionized water in the laboratory and then processed in the field in the same manner as water samples from each station (i.e., uncapped, treated with preservative, re-capped). Five field duplicates and three field blanks were collected over the five sampling events.

2.3.3.2 Laboratory and Data Analysis QA/QC

Laboratory QA/QC reports were reviewed upon receipt to confirm adherence to sample hold times and laboratory data quality objectives (DQOs), and that the appropriate QA/QC information had been reported. Laboratory QA/QC included verification of recommended sample holding times and the analysis of laboratory control samples, laboratory duplicates, and spiked samples to assess the reliability and reproducibility of the data.

The analysis of field QC samples involved a review of field blank results. Notable results were those detected in the field blanks that were greater than five times the respective DL, in accordance with the BC Field Sampling Manual (BC MWLAP 2013). To assess variability between field duplicates, the Relative Percent Difference (RPD) was calculated as follows:

$$RPD = \left(\frac{sample - duplicate}{(sample + duplicate)/2}\right) \times 100$$

In accordance with the BC Field Sampling Manual (BC MWLAP 2013), an RPD value of >20% was used to identify differences between original and duplicate samples. Values less than five times the Method Detection Limit (MDL) were not included in the RPD calculations because analytical variability near the MDL is higher and does not provide a good measure of variability associated with the collection of field samples.

2.3.4 TARP Assessment

As part of applying the Trigger Action Response Plan (TARP), water quality performance indicators were screened against condition status/thresholds in 2023, in order to assess risk levels for each performance indicator (Table 2-2).

Table 2-2: Marine Environment TARP Framework for Water Quality (Baffinland 2023)

Component	Performance Indicators	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Water Quality	• Metals • TSS • Hydrocarbons • Nutrients	30-day mean concentration of a parameter is greater than 75% of an applicable CCME long-term guideline[1]. AND Effluent monitoring and spatial and temporal water quality data suggest a pattern indicative of effects from the Port's effluent discharge	Confirmed[2] exceedance of an effects benchmark or an applicable CCME long-term guideline[2] by a mean concentration. AND Effluent monitoring and spatial and temporal water quality data suggest that the confirmed increase in this parameter is related to the Port's effluent discharge.	To be determined based on outcome of moderate response investigations.

[1] Canadian Council of Minsters of the Environment (CCME) water quality guidelines for the protection of marine aquatic life. With the exception of silver, total suspended solids (TSS), and turbidity, these are long-term water quality guidelines intended to be applied to the average concentration at a receiving environment station collected over a 5-in-30 sampling program (i.e., average of 5 discrete samples collected over a 30-day period). In lieu of a long-term guideline for silver, the short-term guideline will be applied to discrete measured concentrations. The long-term guidelines for TSS and turbidity will be used.

[2] Confirmed indicates that the Risk Status/ Threshold trigger has been observed in at least two consecutive monitoring programs, whether during the regular monitoring schedule or confirmed through a special study.

2.4 Results

2.4.1 QA/QC Results

The 2023 marine water quality data were considered valid based on the results of the QA/QC assessment provided in Appendix 2D for the following reasons:

- Most chemical analyses on surface water samples were completed within the sample hold time requirements, with the exception of some hold time exceedances for parameters such as DOC, nitrite, nitrate, turbidity, and pH (Appendix 2D). Although exceedances of sample hold time requirements have been documented, the hold times for the parameters in question are relatively short. Given the remote location of the site, such exceedances were unavoidable, and so efforts were taken to minimize the extent of any hold time exceedances. The hold time exceedances did not affect interpretation of the 2023 water quality data. Baffinland continues to minimize hold time exceedances where feasible given the northern location of the sampling program.
- Water sample temperature was slightly above laboratory thresholds (< 10ºC) in three of the five sampling events (VA23B8519, VA23B9367, and VA23C0016), with measured sample temperatures between 12 and 17ºC. These water temperatures did not affect interpretation of the data and were for a limited time period.
- Data reported by the laboratory were considered reliable according to the accredited laboratory QA/QC assessment because there was a low frequency and magnitude of notable detected concentrations in blank QC samples and low variability between duplicates QC samples (Appendix 2D).

Overall, the QA/QC results indicate that the water chemistry data collected during the 2023 MEEMP are of acceptable quality to address the objectives stated in Section 2.1.1.

2.4.2 Marine Water Quality Results

Field water quality measurements are documented in Appendix 2A, and laboratory reports are provided in Appendix 2B. The field measurements and laboratory raw data for each station sampled in 2023 are summarized in Appendix 2C. Summary statistics (mean, maximum, and minimum) for the 2023 water quality program calculated from these data are presented in Table 2-3. Summary statistics for parameters of interest for the seven monitoring years between 2015 and 2023 are provided in Appendix 2E – Table 1.

2.4.2.1 Conventional Parameters

The pH values in 2023 water samples collected downstream of both discharge points ranged from 7.8 to 8.0 (Table 2-3) and were within the CCME WQG range for marine waters (7.0 to 8.7) and within the pH range (7.0 – 8.2) reported in previous years (Appendix 2E – Table 1). Total suspended solids were low in most samples (<2 mg/L in 36 of 40 collected samples), with a maximum concentration of 3.1 mg/L in a sample collected from the MP-06 North location on 15 August 2023. Turbidity levels were similarly low (<0.1 NTU to 1.6 NTU) and both TSS and turbidity values were below CCME WQGs and within previously observed annual ranges (Appendix 2E – Table 1). Salinity ranged from 1,000 mg/L to 32,000 mg/L in 2023, reflective of an estuarine environment (i.e., one that fluctuates between brackish and fully saline) and dissolved oxygen levels at all stations were indicative of well-oxygenated conditions (>90% saturation; >9.9 mg/L) (Table 2-3).

2.4.2.2 Nutrients

Nutrients were mostly undetectable over the five sampling events and where detected, concentrations were low and below applicable CCME WQGs[4]. Nitrate concentrations downstream of both discharges in 2023 were largely below the detection limit, with a combined mean concentration of 0.02 mg-N/L and a maximum concentration of 0.19 mg-N/L. Nitrate concentrations in 2023 were consistent with those reported in 2022 for the MP-05 and MP-06 discharge stations, with similar mean concentrations (Table 2-3; Appendix 2E – Table 1). Nitrite concentrations were below detection in 2023, and the combined mean concentration of total ammonia was 0.006 mg-N/L (Table 2-3; Appendix 2C).

2.4.2.3 Metals

Measured metal concentrations downstream of both discharges were lower than applicable CCME WQGs over the five sampling events.

Total concentrations for a number of metals[5] were low and often not detectable in each of the 2023 samples (Appendix 2C). For other metals (i.e., chromium and iron), detectable concentrations were driven by the particulate form as corresponding dissolved concentrations were below detection limits.

Iron is the metal of primary interest for the MEEMP. A CCME marine WQG for iron is not available and, as such, the 2023 iron data were compared to the 2015 and 2022 range measured downstream from the MP-05 and MP-06[6] discharges (Table 2-3, Appendix 2E – Table 1). Iron concentrations detected downstream of both discharges in 2023 were within detected concentrations measured from 2017 to 2022, which ranged from <10 to 286 mg/L (Appendix 2E – Table 1). The maximum total iron concentration in 2023 (40 µg/L) is below the maximum total iron concentration of 96 µg/L measured in 2022 (Table 2-3, Figure 2-2, Figure 2-3). Total iron concentrations were below detection limits in 17 of the 40 samples collected in 2023.

The temporal trend in iron concentrations for the MP-05 and MP-06 sampling locations from 2017 onwards is shown in Figure 2-2 and Figure 2-3. Total iron concentrations in marine water samples collected in 2023 remained within the range measured in previous years in the receiving environments of the MP-05 and MP-06 site discharges, and was lower than measured in 2022. Dissolved iron concentrations were below detection limits in each of the samples collected in 2023 (Table 2-3), meaning the majority of detectable iron concentrations were driven by the particulate form and less bioavailable for uptake by aquatic biota.

[4] No CCME marine WQGs are available for ammonia and nitrite.

[5] Total antimony, beryllium, bismuth, cesium, gallium, mercury, nickel, phosphorus, rhenium, selenium, silicon, silver, tellurium, thallium, thorium-232, tin, titanium, tungsten, yttrium, and zinc.

[6] Receiving water quality data for the MP-06 discharge are only available from 2020 onwards.

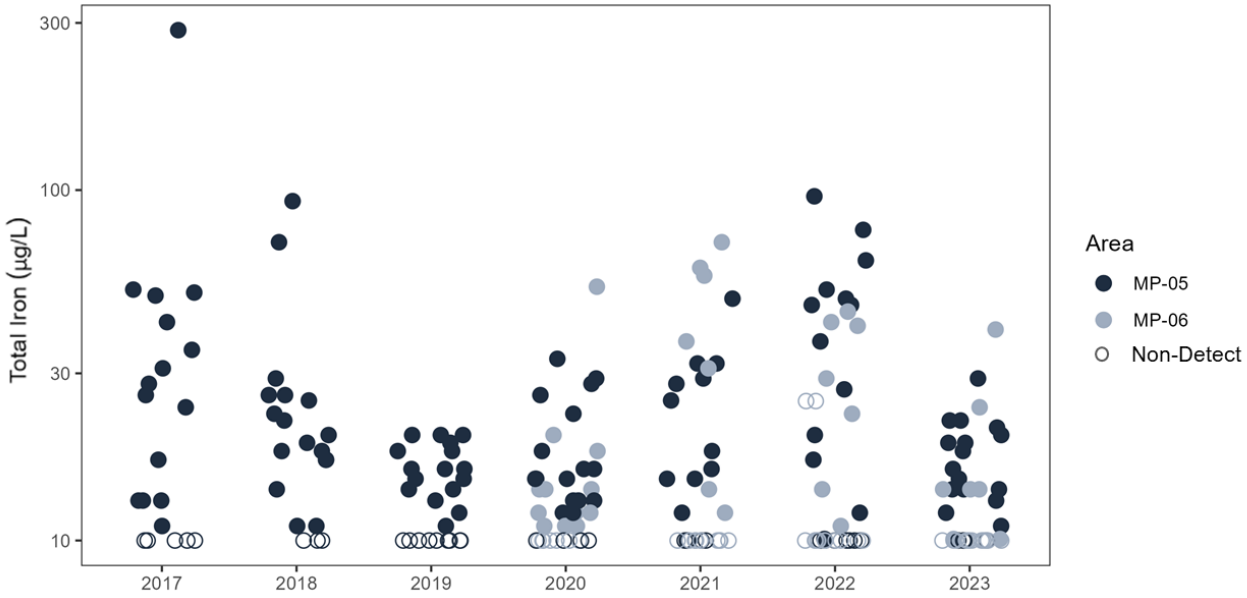

Figure 2-2: Receiving Environment Total Iron Concentrations in Milne Inlet for the MP-05 and MP-06 Milne Port Site Discharges, (2017-2023).

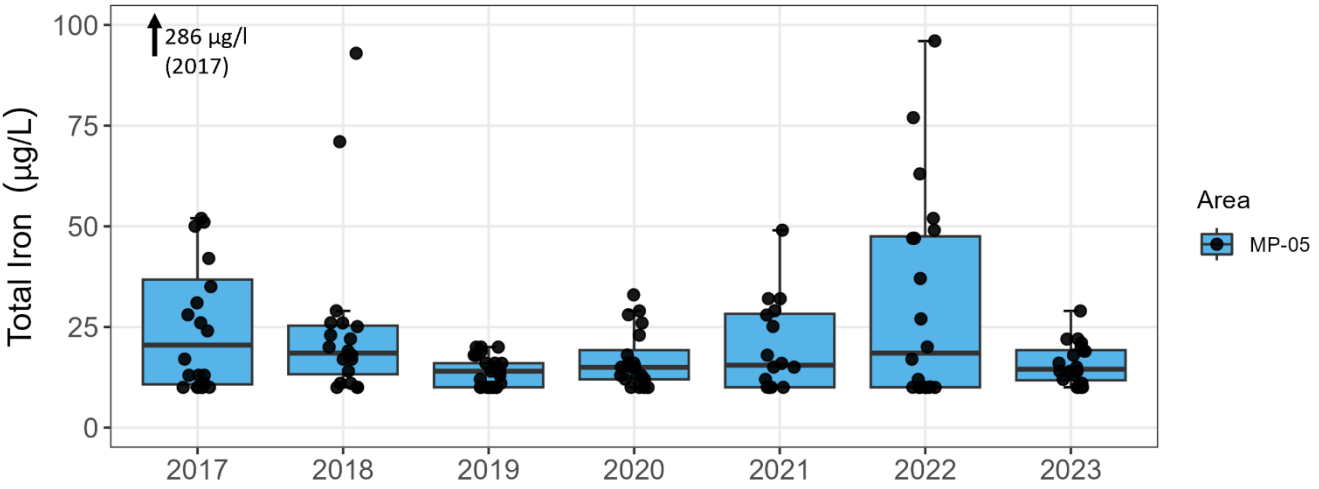

Figure 2-3: Receiving Environment Total Iron Concentrations in Milne Inlet for the MP-05 Milne Port Site Discharges, (2017-2023).

In addition to iron, several other metals of interest also do not have CCME marine WQGs. In these cases, comparisons of 2023 concentrations were made to the ranges reported in the 2015 to 2022 MEEMP water quality dataset (Appendix 2E – Table 1). These comparisons indicate that all measurements downstream from the primary site discharges MP-05 and MP-06 in 2023 were within range reported from previous years, and decreasing for the most part. In 2022, the mean total copper concentration of 3.5 µg/L for MP-05 and MP-06 (combined) was higher than mean concentrations calculated for previous years. However, in the 2023 sampling program, mean total copper concentrations were 1.2 µg/L, roughly 3-times lower than that measured in 2022 (Figure 2-4 and Figure 2-5), with less variability in the 2023 measurements.

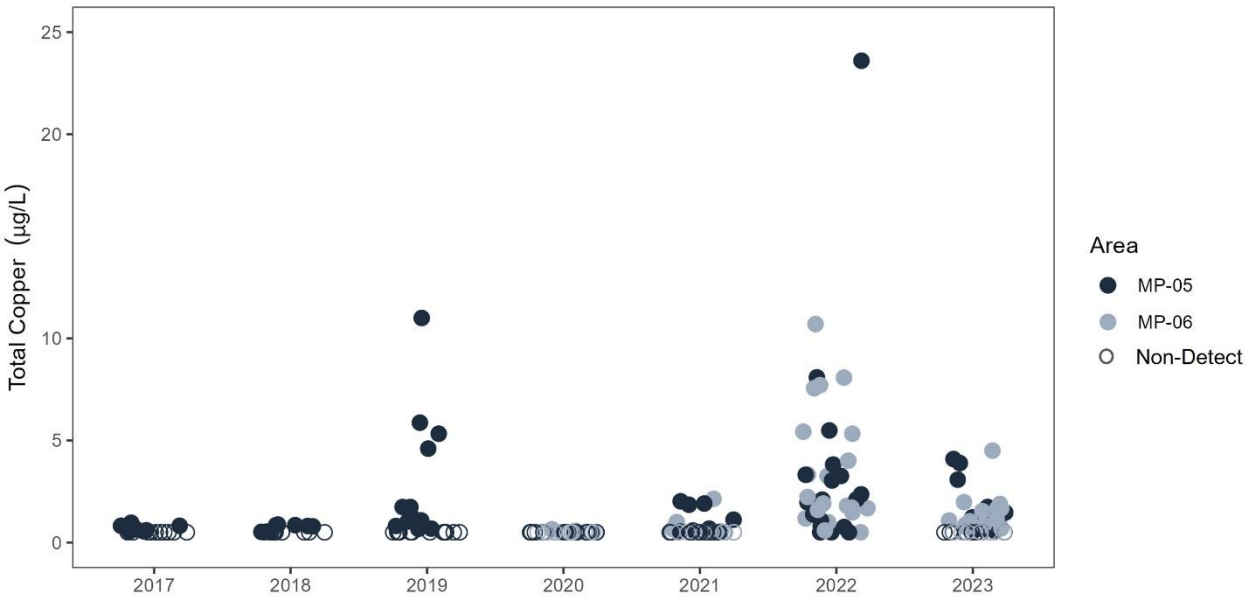

Figure 2-4: Receiving Environment Total Copper Concentrations in Milne Inlet for the MP-05 and MP-06 Milne Port Site Discharges, (2017-2023).

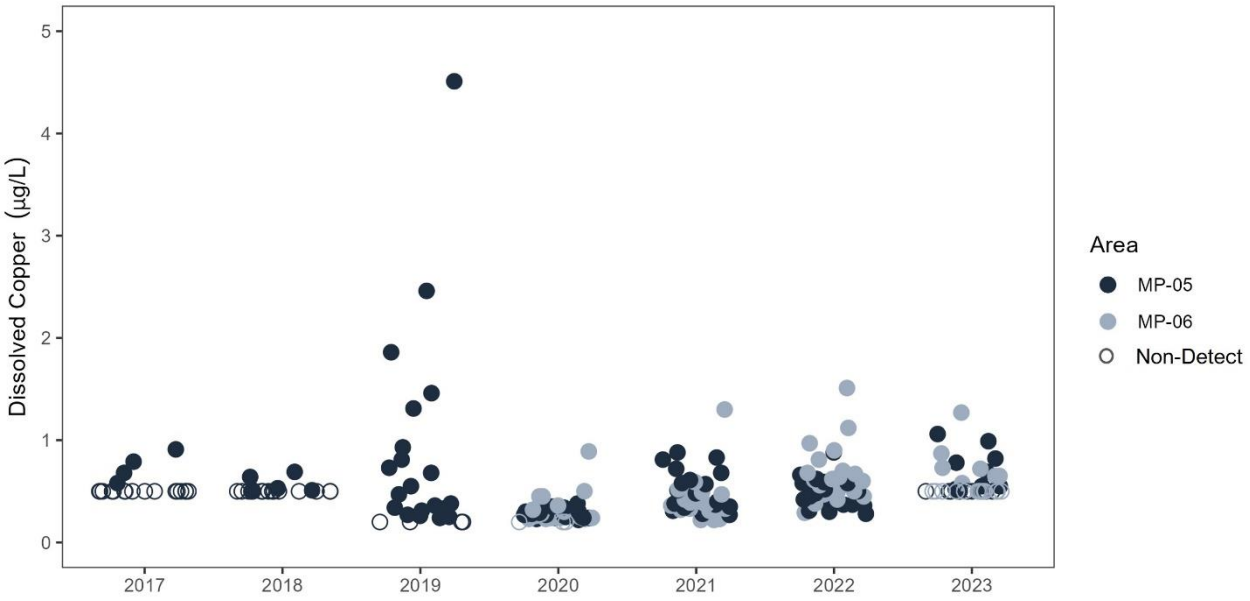

Figure 2-5: Receiving Environment Dissolved Copper Concentrations in Milne Inlet for the MP-05 and MP-06 Milne Port Site Discharges, (2017-2023).

2.4.2.4 Analysis of Temporal Trends of Iron Concentrations

In the analysis of MP-05 data, the interaction between year (as a continuous variable) and station was not significant, as was the main effect of year (P>0.9 for both). That is, there was no significant temporal trend in total iron concentration, with the largest absolute changes in iron concentrations ranging from -7%/year for ENE, WNW, and Source in 2018 to +2%/year for N in 2020 (Figure 2-6). The main effect of station was significant (P=0.039), with effect sizes ranging from -20% (difference between ENE and Source sites) and +21% (difference between Source and WNW sites); however, none of the pairwise comparisons were significant (P>0.4 for all).

There was sufficient power to detect a single-year decrease or increase in iron concentrations at effect sizes of -60% and +120%, respectively (Appendix 2F). Observed maximum effect sizes for every two consecutive years in the data were small and ranged from +5% (comparison between 2020 and 2019 for N) and +15% (comparison between 2021 and 2020 for Source). Due to the low statistical power to detect relevant effect sizes, the temporal effects should be assessed using effect sizes rather than a strict adherence to statistical significance.

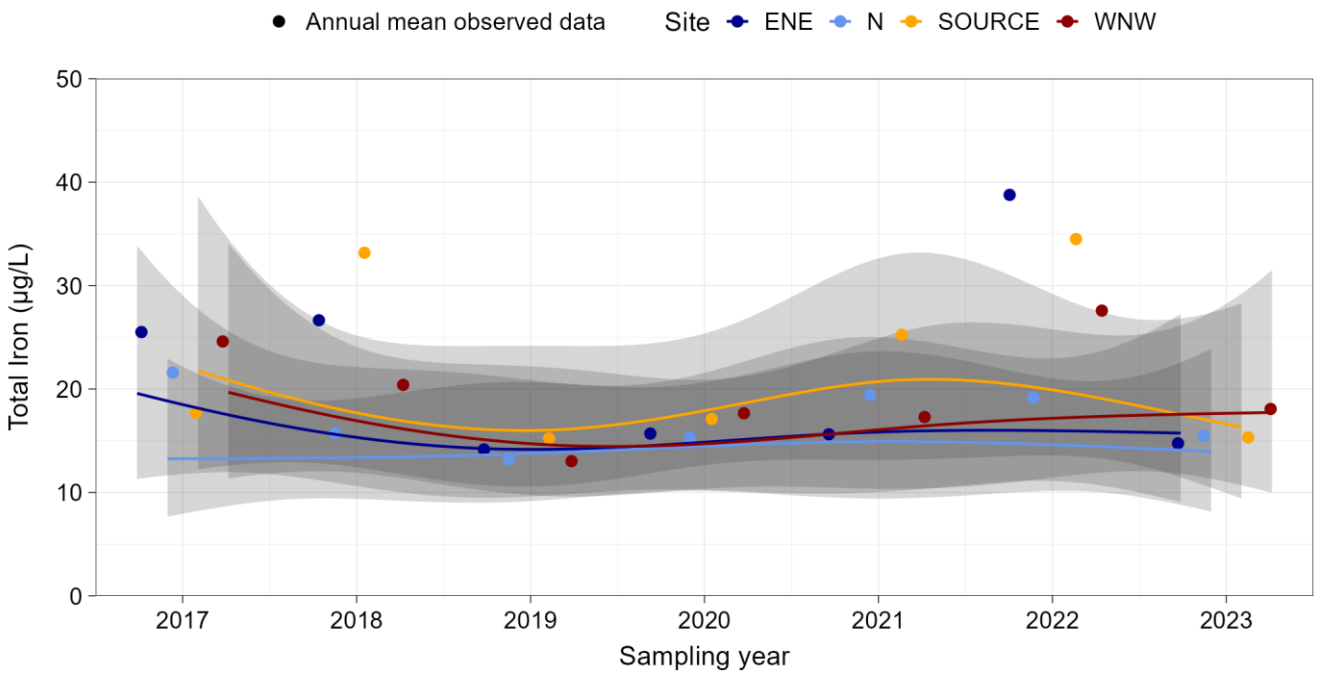

Figure 2-6: Observed Annual Means (Points) and Estimated (Lines and Ribbons) Iron Concentrations in Milne Inlet for the MP-05 Milne Port Site, 2017-2023. Ribbons are 95% Confidence Intervals.

In the analysis of MP-06 data, the interaction between year (as a categorical variable) and station was significant (P<0.001), indicating a difference in temporal trends of iron concentrations between sites (Figure 2-7). Overall, 2023 estimates were lower than previous sampling years in 10 out of the 12 comparisons, with effect sizes ranging from -83% (comparison between 2023 and 2022 for ENE) and -3% (comparison between 2023 and 2021 for Source). In the two cases where 2023 were not lower than previous sampling years, the effect sizes were small, with values of +12% (comparison between 2023 and 2020 for Source) and +14% (comparison between 202023 and 2022 for N).

Of the multiple comparisons between years within each site, 2023 values for ENE were 77% lower than 2020 (*P*=0.023), 81% lower than 2021 (*P*=0.015), and 83% lower than 2022(*P*=0.004). None of other the pairwise comparisons were significant (*P*>0.1 for all), despite large effect sizes, ranging from a 68% decrease in iron between 2020 and 2022 for N to a 47% increase in iron between 2020 and 2022 for Source. That is, at MP-06, iron concentrations at ENE were significantly lower in 2023 compared to all previous years, while no significant temporal differences were found for the remaining three sites despite large effect sizes. There was sufficient power to detect a single-year decrease or increase in iron concentrations at effect sizes of -60% and +150%, respectively (Appendix 2F). Due to the low statistical power to detect relevant effect sizes, the temporal effects should be assessed using effect sizes rather than a strict adherence to statistical significance.

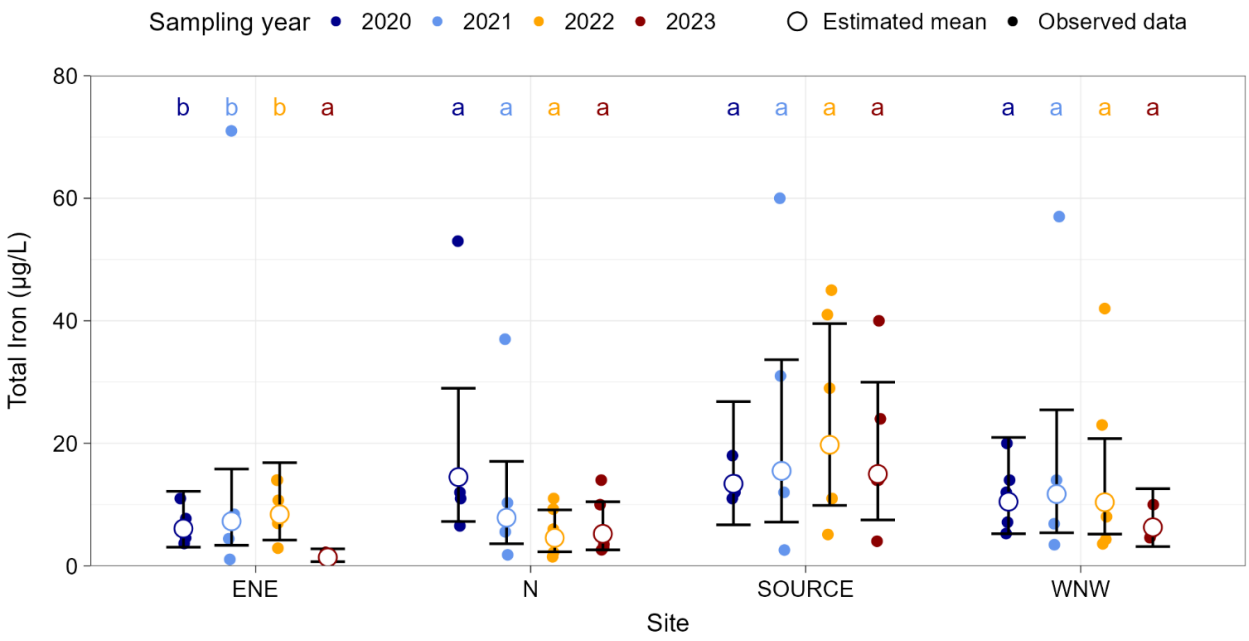

Figure 2-7: Observed (Points) and Estimated (Lines and Error Bars) Iron Concentrations in Milne Inlet for the MP-06 Milne Port Site, 2020-2023. Error bars are 95% Confidence Intervals. Years with Different Letters Indicate Significant Difference within the Site.

2.4.2.5 Hydrocarbons

Hydrocarbons and PAHs were not detected in any water quality sample collected during the 2023 MEEMP. Hydrocarbons have consistently been below DLs since sampling was initiated in 2015 (SEM 2016; SEM 2017; Golder 2018; Golder 2019; Golder 2020; Golder 2021; Golder 2022; WSP 2023).

2.4.3 TARP Assessment

Results of the water quality assessment above were screened against the TARP criteria (Table 2-2). The ‘Low Risk’ threshold was not triggered in 2023 because the 30-day mean for each water quality indicator was less than 75% of the applicable CCME water quality guideline for the protection of aquatic life, and iron did not show a spatial pattern or a temporal trend indicative of effects from the Port’s effluent discharge.

Table 2-3: Marine Water Quality – Receiving Environment Summary Statistics for the MP-05 and MP-06 Milne Port Site Discharges over the Five Sampling Events in 2023

Parameter	CCME Marine WQG for Protection of Aquatic Life[a]		MP-05			MP-05			MP-05			MP-05			MP-06			MP-06			MP-06			MP-06

2.5 Discussion

In 2023, concentrations of conventional water quality parameters, major ions, nutrients, and metals were often not detected in the water samples and did not exceed applicable CCME WQGs downstream from either discharge (Table 2-3) and therefore are not anticipated to result in adverse effects on water quality and, by extension, aquatic biota in the receiving environment. Where guidelines were not available, maximum concentrations downstream of both discharges were within detected concentration ranges measured from the 2015 to 2022 MEEMP water quality dataset and decreasing for many analytes when compared to previous years. For both discharges, hydrocarbons and PAHs were not detected in downstream water samples, consistent with results from previous sampling years. Therefore, monitoring results from 2023 remain within original FEIS predictions (see Table 1-1), which forecasted no significant residual effects on water quality but indicated the potential for minor localized increases in TSS, nutrient, metal, and hydrocarbon concentrations.

Water quality monitoring in 2023 shows that iron concentrations in marine water samples collected in 2023 remained within the range measured in previous years and were lower than measured in 2022. Results of the trend analysis indicated that 2023 MP-06 total iron concentrations were statistically lower than previous sampling years, with effect sizes ranging from -83% (comparison between 2023 and 2022 for ENE) and -3% (comparison between 2023 and 2021 for Source). The 2023 MP-05 concentrations were lower in 2023 than measured in 2022, however statistical significance was not seen in the trend analysis.

It should be noted that for iron to be biologically available to phytoplankton and other marine biota, it generally needs to be in a dissolved form so that it can effectively cross biological membranes. Because iron ore particulates stored at the site are in mineral form, they would be expected to predominantly settle in marine sediments where they would be biologically inert. Dissolved iron concentrations were below detection limits in each of the samples collected in 2023, meaning the majority of detectable iron concentrations were driven by the particulate form and less bioavailable for uptake by aquatic biota. Environmental conditions in the receiving environment, such as pH, dissolved oxygen concentrations, and redox potential, can influence the proportion of biologically available iron that can be released from particulates into surrounding waters. According to Millero (1998) and Lis et al. (2015), in circumneutral pH and well oxygenated environments, similar to those observed in Milne Inlet, iron tends to be poorly soluble. As a result, many open ocean waters and some freshwater systems are characterized by low dissolved iron concentrations (Johnson et al 1997; McKay et al 2004). Accordingly, iron deposition from the Project, at both present levels and in its current form, is not expected to adversely effect aquatic life.

2.6 Conclusions and Recommendations

Site drainage and effluent discharge to the marine environment does not appear to have resulted in adverse effects on marine water quality, as measured concentrations in downstream waters were generally low and/or undetectable, below applicable guidelines, and largely consistent with previous years' measurements. With respect to iron, which is of primary concern for the Project, concentrations remain within the range measured in previous years in the receiving environments of the MP-05 and MP-06 site discharges and have decreased in comparison to the 2022 program. A clear visual trend of increased iron concentrations detected in water samples collected between 2015 and 2023 has not been observed from the laboratory analysis. Results of the trend analysis indicated that 2023 MP-06 total iron concentrations were statistically lower than previous sampling years, with effect sizes ranging from -83% (comparison between 2023 and 2022 for ENE) and -3% (comparison between

2023 and 2021 for Source). The 2023 MP-05 concentrations were lower in 2023 than measured in 2022, however statistical significance was not seen in the trend analysis. For water quality in general, monitoring results remain within original FEIS predictions, which forecasted no significant residual effects on water quality but indicated the potential for minor localized increases in TSS, nutrient, metal, and hydrocarbon concentrations.

These results confirm that mitigation measures are functioning as intended and that Project activities are being managed in a way that has not adversely affected marine water quality. Moving forward, annual marine water quality monitoring is recommended to continue to evaluate whether site operations are affecting downstream water chemistry and to provide continuity in the established time series for the MEEMP. This recommendation is in line with commitments in the Project Certificate and the terms of the Type A Water Licence. Monitoring also serves to confirm that mitigation measures in place are working and to inform if additional mitigation or other adaptive management measures are required.

2.7 Closure

We trust this information is sufficient for your needs at this time. Should you have any questions or concerns, please do not hesitate to contact Phil Rouget, on behalf of the undersigned, at +1 250 419 4945.

Brieanna Allen	Production/Validation Manager	Inorganics, Burnaby, British Columbia
Chamoi Beckford	Lab Assistant	Metals, Burnaby, British Columbia
Christopher Li	Lab Assistant	Metals, Burnaby, British Columbia
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Prinson Dsilva	LIMS Support / Training Officer	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Tony Nguyen	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

For sample #3 "MP05-ENE-1-23", total Hg was marked as filtered, and Dissolved Hg was not. Hg will be run from the metals bottles. Results may be qualifiifed.

Qualifiers

Qualifier	*Description*
RRV	*Reported result verified by repeat analysis.*
SFP	*Sample was filtered and preserved at the laboratory.*

No. of samples analysed	: 10		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Alex Thornton	Analyst	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Anshim Anshim	Lab Assistant	Metals, Burnaby, British Columbia
Brieanna Allen	Production/Validation Manager	Inorganics, Burnaby, British Columbia
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
HTP	*Sample preparation or preservation hold time was exceeded.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23B8519**	Page	: 1 of 39
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: E Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: GOLD100-028	Date Samples Received	: 11-Aug-2023 11:00
PO	: 166372402/70000/03	Issue Date	: 22-Aug-2023 16:52
C-O-C number	: ----		
Sampler	: NCB/AC/MCR		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Total Metals	QC-1086630-002	----	Copper, total	7440-50-8	E466S	129 % MES	80.0-120%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	1082763	1	18	5.5	5.0	✓
Ammonia by Fluorescence	E298	1083077	1	11	9.0	5.0	✓
Bromide in Seawater by IC	E235S.Br	1082765	1	12	8.3	5.0	✓
BTEX by Headspace GC-MS	E611A	1095101	1	7	14.2	5.0	✓
Chloride in Seawater by IC	E235S.Cl	1082766	1	18	5.5	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

QUALITY CONTROL REPORT

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Drinking Water (DW) Samples[1] (client use):	Notes / Specify Limits for result evaluation by selecting from drop-down below (Excel COC only)
Are samples taken from a Regulated DW System? ☐ YES ☑ NO	
Are samples for human consumption/ use? ☐ YES ☑ NO	Refer to quote (GOLD100-028) for all analyses.

SAMPLE RECEIPT DETAILS (ALS use only)

Cooling Method: ☐ NONE ☐ ICE ☑ ICE PACKS ☐ FROZEN ☐ COOLING INITIATED

Submission Comments identified on Sample Receipt Notification: ☐ YES ☐ NO

Cooler Custody Seals Intact: ☐ YES ☐ N/A Sample Custody Seals Intact: ☐ YES ☐ N/A

INITIAL COOLER TEMPERATURES °C				FINAL COOLER TEMPERATURES °C			
				11	16	12	12

WHITE - LABORATORY COPY YELLOW - CLIENT COPY

AUG 2020 FRONT

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a Regulated Drinking Water (DW) System, please submit using an Authorized DW COC form.

CERTIFICATE OF ANALYSIS

Work Order	: **VA23B8529**	Page	: 1 of 9
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372402/70000/03	Date Samples Received	: 11-Aug-2023 11:00
PO	: 166372402/70000/03	Date Analysis Commenced	: 12-Aug-2023
C-O-C number	: ----	Issue Date	: 25-Aug-2023 11:21
Sampler	: TT/MR/DV		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Brieanna Allen	Production/Validation Manager	Inorganics, Burnaby, British Columbia
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Ilnaz Badbezanchi	Supervisor - Metals Prep & Mercury	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical Results

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23B8529**	Page	: 1 of 20
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372402/70000/03	Date Samples Received	: 11-Aug-2023 11:00
PO	: 166372402/70000/03	Issue Date	: 25-Aug-2023 11:21
C-O-C number	: ----		
Sampler	: TT/MR/DV		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	1082763	1	18	5.5	5.0	✓
Ammonia by Fluorescence	E298	1091060	1	17	5.8	5.0	✓
Bromide in Seawater by IC	E235S.Br	1082765	1	12	8.3	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 10		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Anshim Anshim	Lab Assistant	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Tony Nguyen	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
RRV	*Reported result verified by repeat analysis.*
SFP	*Sample was filtered and preserved at the laboratory.*
SUR-ND	*Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **YL2301042**	Page	: 1 of 41
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Yellowknife
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 314 Old Airport Road, Unit 116 Yellowknife, Northwest Territories Canada X1A 3T3
Telephone	: ----	Telephone	: +1 867 873 5593
Project	: 166372402/70000/03	Date Samples Received	: 14-Aug-2023 10:00
PO	: 166372402/70000/03	Issue Date	: 23-Aug-2023 14:34
C-O-C number	: ----		
Sampler	: MCR, NOB, SD		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 10		
No. of samples analysed	: 10		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- Test sample Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Physical Tests	QC-MRG2-1089071 001	----	Conductivity	----	E100S	4.4 B µS/cm	2 µS/cm	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Regular Sample Surrogates

Sub-Matrix: **Seawater**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Result	Limits	Comment
Samples Submitted							
Hydrocarbons Surrogates	YL2301042-005	MP-06-Source-2-23	Dichlorotoluene, 3,4-	95-75-0	61.9 %	70.0-130 %	Recovery less than lower data quality objective

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

QUALITY CONTROL REPORT

Work Order	: **YL2301042**	Page	: 1 of 21
Client	: WSP Canada Inc.	Laboratory	: ALS Environmental - Yellowknife
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 314 Old Airport Road, Unit 116 Yellowknife, Northwest Territories Canada X1A 3T3

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Sukhman Khosa	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **YL2301044**	Page	: 1 of 15
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Yellowknife
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 314 Old Airport Road, Unit 116 Yellowknife, Northwest Territories Canada X1A 3T3
Telephone	: ----	Telephone	: +1 867 873 5593
Project	: 166372402/70000/03	Date Samples Received	: 14-Aug-2023 10:00
PO	: ----	Issue Date	: 23-Aug-2023 17:00
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Total Metals	QC-1093977-002	----	Boron, total	7440-42-8	E466S	124 % B	80.0-120%	Recovery greater than upper control limit
Dissolved Metals	QC-1093435-002	----	Boron, dissolved	7440-42-8	E465S	122 % MES	80.0-120%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	*Description*
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

					Laboratory Control Sample (LCS) Report

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Tony Nguyen	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23B9367**	Page	: 1 of 41
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: E Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: GOLD100-028	Date Samples Received	: 19-Aug-2023 11:00
PO	: 166372402/70000/03	Issue Date	: 30-Aug-2023 10:43
C-O-C number	: ----		
Sampler	: TT		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 10		
No. of samples analysed	: 10		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Matrix Spike (MS) Recoveries								
Dissolved Metals	VA23B9367-002	MP05-North-1-23	Beryllium, dissolved	7440-41-7	E465S	134 % MES	70.0-130%	Recovery greater than upper data quality objective

Result Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	1096613	1	10	10.0	5.0	✓
Ammonia by Fluorescence	E298	1093980	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

QUALITY CONTROL REPORT

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

					Laboratory Control Sample (LCS) Report				
					Spike	Recovery (%)	Recovery Limits (%)		
Analyte	CAS Number	Method	LOR	Unit	Concentration	LCS	Low	High	Qualifier

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Erin Sanchez		Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Inorganics, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Parnian Sane	Analyst	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
µg/L	micrograms per litre
µS/cm	microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units
psu	practical salinity units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	VA ALS Environmental - Vancouver	8081 Lougheed Highway, Burnaby, BC

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Qualifiers

Qualifier	*Description*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*
HTP	*Sample preparation or preservation hold time was exceeded.*
SFP	*Sample was filtered and preserved at the laboratory.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23C0016**	Page	: 1 of 38
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: E Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372402/70000/03	Date Samples Received	: 26-Aug-2023 13:40
PO	: 166372402/70000/03	Issue Date	: 06-Sep-2023 16:14
C-O-C number	: ----		
Sampler	: TT/MR/DV		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Anions and Nutrients	QC-1111331-001	----	Phosphorus, total dissolved	7723-14-0	E375-T	0.0028 B mg/L	0.002 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Seawater	E100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
pH by Meter	E108 ALS Environmental - Vancouver	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 ALS Environmental - Vancouver	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry (Seawater)	E160S ALS Environmental - Vancouver	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids.
TDS by Gravimetry (Seawater)	E162S ALS Environmental - Vancouver	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Seawater by IC	E235S.Br ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Seawater by IC	E235S.Cl ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Seawater by IC (Low Level)	E235S.F-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Seawater by IC (Low Level)	E235S.NO2-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Seawater by IC (Trace Level)	E235S.NO3-T ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Seawater by IC (Low Level)	E235S.SO4-L ALS Environmental - Vancouver	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 ALS Environmental - Vancouver	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	Ammonia in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Kjeldahl Nitrogen in Seawater by Fluorescence	E318S ALS Environmental - Vancouver	Water	Method Fialab 100, 2018	TKN in water is determined by automated continuous flow analysis with membrane diffusion and fluorescence detection, after reaction with OPA (ortho-phthalaldehyde). This method is approved under US EPA 40 CFR Part 136 (May 2021)
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus in Seawater by Colourimetry (0.002 mg/L)	E372S ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (0.002 mg/L)	E375-T ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Dissolved Metals in Seawater by Triple Quad ICPMS	E465S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Triple Quadrupole ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Metals in Seawater by Triple Quad ICPMS	E466S ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Triple Quadrupole ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Total Sodium and Silicon in Seawater by CRC ICPMS	E468S.NaSi ALS Environmental - Vancouver	Water	EPA 200.2/6020B (mod)	Seawater samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. This method is compliant with digestion requirements of the British Columbia Environmental Laboratory Manual.
Dissolved Sodium and Silicon in Seawater by CRC ICPMS	E469S.NaSi ALS Environmental - Vancouver	Water	APHA 3030B/EPA 6020B (mod)	Seawater samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS.
Total Mercury in Seawater by CVAAS	E508S ALS Environmental - Vancouver	Water	EPA 1631E (mod)	Seawater samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Mercury in Seawater by CVAAS	E509S ALS Environmental - Vancouver	Water	APHA 3030B/EPA 1631E (mod)	Seawater samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Water	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	Sample extracts are analyzed by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BC PHCs - EPH by GC-FID	E601A ALS Environmental - Vancouver	Water	BC MOE Lab Manual	Sample extracts are analyzed by GC-FID for BC hydrocarbon fractions.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Water	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
PAHs by Hexane LVI GC-MS	E641A ALS Environmental - Vancouver	Water	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are analyzed by large volume injection (LVI) GC-MS.
Dissolved Hardness (Calculated)	EC100 ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A ALS Environmental - Vancouver	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Salinity in Water (calculation)	EC100S ALS Environmental - Vancouver	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a seawater sample. Conductivity measurements are temperature-compensated to 25°C. Salinity in Practical Salinity Units is calculated.
F1-BTEX	EC580 ALS Environmental - Vancouver	Water	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).
VPH: VH-BTEX-Styrene	EC580A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (VPH in Water and Solids) (mod)	Volatile Petroleum Hydrocarbons (VPH) is calculated as follows: VPHw = Volatile Hydrocarbons (VH6-10) minus benzene, toluene, ethylbenzene, xylenes (BTEX) and styrene.
LEPH and HEPH: EPH-PAH	EC600A ALS Environmental - Vancouver	Water	BC MOE Lab Manual (LEPH and HEPH)	Light Extractable Petroleum Hydrocarbons (LEPH) and Heavy Extractable Petroleum Hydrocarbons (HEPH) are calculated as follows: LEPH = Extractable Petroleum Hydrocarbons (EPH10-19) minus Acenaphthene, Acridine, Anthracene, Fluorene, Naphthalene and Phenanthrene; HEPH = Extractable Petroleum Hydrocarbons (EPH19-32) minus Benz(a)anthracene, Benzo(a)pyrene, Fluoranthene, and Pyrene.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 ALS Environmental - Vancouver	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in Seawater	EP318S ALS Environmental - Vancouver	Water	APHA 4500-Norg D (mod)	Samples are digested at high temperature using Sulfuric Acid with Copper catalyst, which converts organic nitrogen sources to Ammonia, which is then quantified by the analytical method as TKN. This method is unsuitable for samples containing high levels of nitrate. If nitrate exceeds TKN concentration by ten times or more, results may be biased low.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Total Organic Carbon by Combustion	EP355 ALS Environmental - Vancouver	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 ALS Environmental - Vancouver	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 ALS Environmental - Vancouver	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Metals Seawater Filtration	EP421S ALS Environmental - Vancouver	Water	PUGET SOUND PROTOCOLS, EPA 6020A	This analysis is carried out using procedures adapted from "Recommended Guidelines for Measuring Metals in Puget Sound Marine Water, Sediment, and Tissue Samples" prepared for the United States Environmental Protection Agency and the Puget Sound Water Quality Authority, 1995. The procedures may involve preliminary sample treatment by acid digestion or filtration (EPA Method 3005A). Instrumental analysis is by Collision/Reaction Cell ICPMS.
Dissolved Mercury Water Filtration	EP509 ALS Environmental - Vancouver	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
VOCs Preparation for Headspace Analysis	EP581 ALS Environmental - Vancouver	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.
PHCs and PAHs Hexane Extraction	EP601 ALS Environmental - Vancouver	Water	EPA 3511 (mod)	Petroleum Hydrocarbons (PHCs) and Polycyclic Aromatic Hydrocarbons (PAHs) are extracted using a hexane liquid-liquid extraction.

QUALITY CONTROL REPORT

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Notes:

(VI), hexavalent chromium

BTEX - Benzene, Toluene, Ethylene and Xylene; F1, F2, F3. F4 - Fractions of hydrocarbons; CCME - Canadian Council of Ministers for the Environment; MP-05 - monitoring stations west of the ore dock, downstream from the MP-05 discharge in a radial design; MP-06 - monitoring stations east of the ore dock; N - nitrogen; NTU - Nephelometric Turbidity Units; pH - scale of acidity; VOC - volatile organic

CCME MARINE - LONG TERM GUIDELINE EXCEEDANCE

CCME MARINE - SHORT TERM GUIDELINE EXCEEDANCE

Notes:

(VI), hexavalent chromium

BTEX - Benzene, Toluene, Ethylene and Xylene; F1, F2, F3. F4 - Fractions of hydrocarbons; CCME - Canadian Council of Ministers for the Environment; MP-05 - monitoring stations west of the ore dock, downstream from the MP-05 discharge in a radial design; MP-06 - monitoring stations east of the ore dock; N - nitrogen; NTU - Nephelometric Turbidity Units; pH - scale of acidity; VOC - volatile organic

CCME MARINE - LONG TERM GUIDELINE EXCEEDANCE

CCME MARINE - SHORT TERM GUIDELINE EXCEEDANCE

APPENDIX 2D

QA/QC Results

1.0 QAQC RESULTS

This appendix describes the QAQC results for surface water sampled for the 2023 MEEMP conducted at Milne Port and in Milne Inlet during the 2023 open-water season. Water quality samples were collected during five sampling events scheduled between 4 August and 23 August 2023, to monitor for potential changes in water quality associated with site drainage and treated effluent discharges to the marine environment (including iron ore stockpile run-off). Samples were collected to align with the confirmed active site discharges.

Most chemical analyses on surface water samples were completed within the sample hold time requirements, with the exception of some hold time exceedances for parameters such as DOC, nitrite, nitrate, turbidity, and pH (Table 1). Although exceedances of sample hold time requirements have been documented, the hold times for the parameters in question are relatively short. Given the remote location of the site, such exceedances were unavoidable, and so efforts were taken to minimize the extent of any hold time exceedances. The hold time exceedances did not affect interpretation of the 2023 water quality data. Baffinland continues to minimize hold time exceedances where feasible given the northern location of the sampling program.

Table 1: Hold time requirements for discrete water quality samples collected at MP-05 and MP-06 marine discharge sites

Analysis	Hold Times	Exceeded Hold Times?	Actual Time
General (pH, Alkalinity, Turbidity, Conductivity, Anions, TSS, DOC, TDS, TOC, Ammonia, TKN, Hardness, Salinity)	15 minutes for pH 3 days for NO_2, NO_3, Turbidity, DOC 7 days for TSS/TDS 14 days for Alkalinity 28 days for Ammonia, Salinity, TKN	Yes – pH, Turbidity, DOC, Nitrite (NO_2), Nitrate (NO_3)	pH – 134 to 181 hours Turbidity, DOC – 4 to 7 days NO_2, NO_3 – 6 to 11 days
Total Metals	6 months	No	N/A
Dissolved Metals	6 months	No	N/A
Total Mercury	28 days	No	N/A
Dissolved mercury	28 days	No	N/A
Petroleum hydrocarbons (BTEX/MTBE/F1)	14 days	No	N/A
Hydrocarbons (LEPH/HEPH), F2-F4, PAHs	14 days	No	N/A
Nutrients (including total phosphorus)	28 days	No	N/A

ALS is certified by the Canadian Association for Laboratory Accreditation (CALA) for the analyses conducted. The analytical laboratory also incorporated and reported the results of internal QA/QC checks. These were used to assess the reliability and reproducibility of the data. Reports from the laboratory are provided in Appendix 2B and were reviewed by WSP. Data reported by the laboratory were considered reliable according to the accredited laboratory QA/QC assessment.

From the field blanks collected during the field program, measured concentrations were generally all less than the analytical detection limit (Appendix D - Table D1). All parameters met QAQC requirements, and field blank concentrations were less than 5-times the detection limit, with the exception of nitrate concentrations being 5.5 and 5.6-times greater than the detection limit in samples MLP A-23 and MLP B-23, respectively, and dissolved zinc concentrations being 5.2 and 6.2-times greater in samples MLP A-23 and MLP B-23, respectively. Sample detection limits were increased by ALS for dissolved hardness, TDS, and total phosphorus.

To demonstrate that the samples and analytical results can be considered valid, representative, and reproducible, five field duplicate samples were collected. The RPD between field duplicate sample results was used to assess duplicate sample data. The RPD is a measure of the variability between two outcomes from the same procedure or process and is calculated as:

$$RPD = \frac{absolute\ value\ (sample\ concentration - duplicate\ concentration)}{mean\ concentration} \times 100$$

An RPD less than 20% for inorganic parameters in water is considered acceptable (BC ENV 2020). The QA/QC results of field RPDs are provided in Appendix D - Table D2. Only one sample exceeded RPD data quality objectives:

- Duplicate B and its parent sample MP-05 Source (sampled 7 August 2023) had a RPD percentage of 153% for total aluminum.

The QA/QC results indicate that the water chemistry data collected during the 2023 MEEMP were of acceptable quality.

Notes:

DF = difference factor; FDA = field duplicate available; FD = field duplicate; Mean = average of two values; mg/kg = milligrams per kilogram; NA = not applicable; NC = not calculated; QA/QC = Quality Assurance/Quality Control; RPD = releative percent difference; < = less than detection limit; VHC = volatile hydrocarbons; VOCs = volatile organic compounds; BTEX = benzen, toluene, ethylbenzene and xylene

When different detection limits are used for the sample and duplicate results, and one detectable result is reported at a value below the detection limit of a non-detectable result, the RPD is not calculated.

Relative percent difference (RPD) = the difference between two values divided by the mean of the two values. RPD is calculated when the concentration is greater than five times the detection limit.

Acceptable RPD for in sediment is less than or equal to 20%.
Difference factor (DF) = absolute difference between two values divided by the method detection limit. The DF is calculated when the concentration is less than five times the detection limit.

Acceptable DF is less than or equal to 2.0.
Bold values indicate an exceedance of the acceptable RPD or DF.

Notes: Bold Font = max exceeding a short term guideline or mean exceeding a long term guideline; (a) = Guidelines from CMME Marine WQG for the protection of Aquatic Life (http://ceqg-rcqe.ccme.ca/download/en/221. CCME = Canadian council of ministers of the environment; WQG = water quality guidelines; Min = minimum; Max = maximum; — = no guideline available; NR = not recorded; PSU = practical salinity unit; TSS = Total suspended solid; mg/L = milligrams per liter; < = less than; N = Nitrogen; CFU = colony forming unit; Cr(VI) = hexavalent chromium; PAH = polycyclic aromatic hydrocarbon; µg/L = micrograms per liter; mL = milliliter.

APPENDIX 2F

Water Quality Power Analysis

POWER ANALYSIS - METHODS

A Type I error is concluding there is a significant effect when none exists (i.e., a false positive). Alpha (α) is the probability of committing a Type I error. A Type II error is the probability of concluding there is no significant effect when there is a real effect of some specified magnitude (i.e., a false negative). Beta (β) is the probability of committing a Type II error. The power of a statistical test (1 - β) is the probability of detecting a real effect. In this analysis, the Type I error-rate (α), also referred to as the significance level, was set to 0.05. The desired minimum statistical power was 80%, which corresponds to a type II error-rate of 0.2. Power analyses were conducted to assess the power of statistical tests under multiple effect sizes. For each model, a set of effect sizes was created, based on preliminary power analyses, so that power >80% was achieved at the largest absolute values of effect sizes, but also so that power is assessed at a range of effect sizes. Both negative and positive effect sizes were used, to assess the power of detecting either a reduction or an increase in values of the response variables. Since the analysis focused on assessment of changes to statistical power at different effect sizes, the power analysis used the observed samples sizes from the collected data.

Data Simulation following Effect Size Application

The power to detect statistically significant effects was estimated using residual bootstrapping in R v. 4.3.2 (R 2023), following the approach of Fox and Weisberg (2018). The general approach was to simulate data based on the model selected for interpretation, the observed sample size, and the residuals, and re-run the models that were used for the original analysis using the simulated data. The data simulation and analysis were repeated 5,000 times, and the proportion of repetitions where the *P*-values of interest were significant ($P<0.05$) was interpreted as the statistical power of the test.

To produce simulated data, the original model was used to predict values of the response variable. The predicted values were then adjusted according to the effect size, depending on the analysis (see below for details). The simulated data were then analyzed using the same model structure as the original analysis. Effect sizes and statistical tests were applied differently to different models, as detailed below.

Effect Sizes

In this power analysis, the question of interest was the models' power to detect a temporal effect at each of the two areas.

To assess the power to detect temporal trends, the effect size was applied relative to the 2022 estimates, and it was only applied to 2023 data, whereas all data collected previously only had an effect size of zero. That is, only 2023 had an effect size applied to it, and an effect size of 0% would mean that 2023 values were identical to those from 2022. This allowed assessing what effect size, relative to the values in 2022, the model would be able to identify as a significant trend. An example of the effect size application to the 2019-2023 fines content dataset is provided in Figure 1.

The simulated data based on effect sizes applied to values of the response variable from 2023 were combined with simulated data from previous years (with an effect size of zero). This combined dataset was analyzed using the models from the original analysis in the main report. To estimate the power to detect a temporal effect for MP-05 data, where a continuous effect of year was used, the significance of all model terms associated with the temporal trend (i.e., main effect and interaction with Site) was assessed, and the minimum *P*-values for the parameters were retained. For the MP-06 model, there were large effect sizes between years, leading to a high proportion of the simulated data resulting in a significant interaction term regardless of the effect size applied during simulation. Therefore, to estimate

the power to detect a temporal effect for MP-06 data, where a categorical effect of year was used, the significance of the pairwise comparison between 2022 and 2023 values was assessed, and the *P*-value for the comparison was retained for the calculation of statistical power.

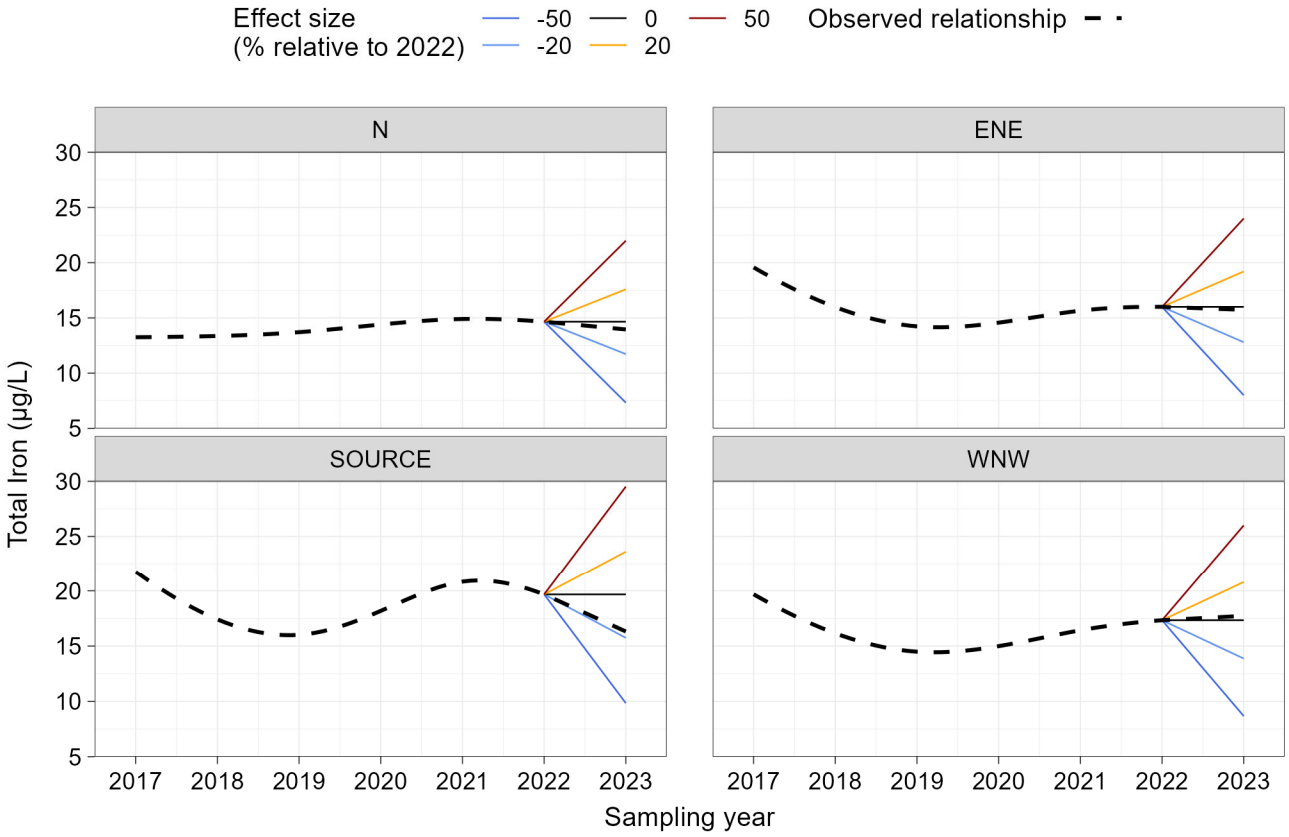

Figure 1: Application of effect sizes to examine effect of year in iron concentrations at MP-05, illustrating how effect sizes are applied relative to the 2022 estimates.

Power Analysis – Reporting of Results

Power curves were produced, showing statistical power as a function of effect size in percentages. Horizontal lines were added to visualize statistical power values of 0.8 (hereafter sufficient power) and 0.9 (hereafter high power), and a vertical line was added to visualize the maximum magnitude of differences that were observed between every two consecutive years in the original analysis.

POWER ANALYSIS – RESULTS

Iron Concentrations for the MP-05 Milne Port Site, 2017-2023

The power analysis indicated that the analysis of iron concentration data collected in 2017-2023 had sufficient power (>0.8) to detect a single-year decrease or increase in iron concentrations at effect sizes of -60% and +120%, respectively (Figure 2). Observed maximum effect sizes were +7% (comparison between 2021 and 2020 for ENE), +5% (comparison between 2020 and 2019 for N), +15% (comparison

between 2021 and 2020 for Source), and +10% (comparison between 2021 and 2020 for WNW). Power to detect the observed effect sizes was low, due to the small observed effect sizes. This is consistent with the lack of statistical significance of either the interaction or the main effect of year in the original analysis (Section 2.4.2.3 in the 2023 MEEMP main report [WSP 2024]).

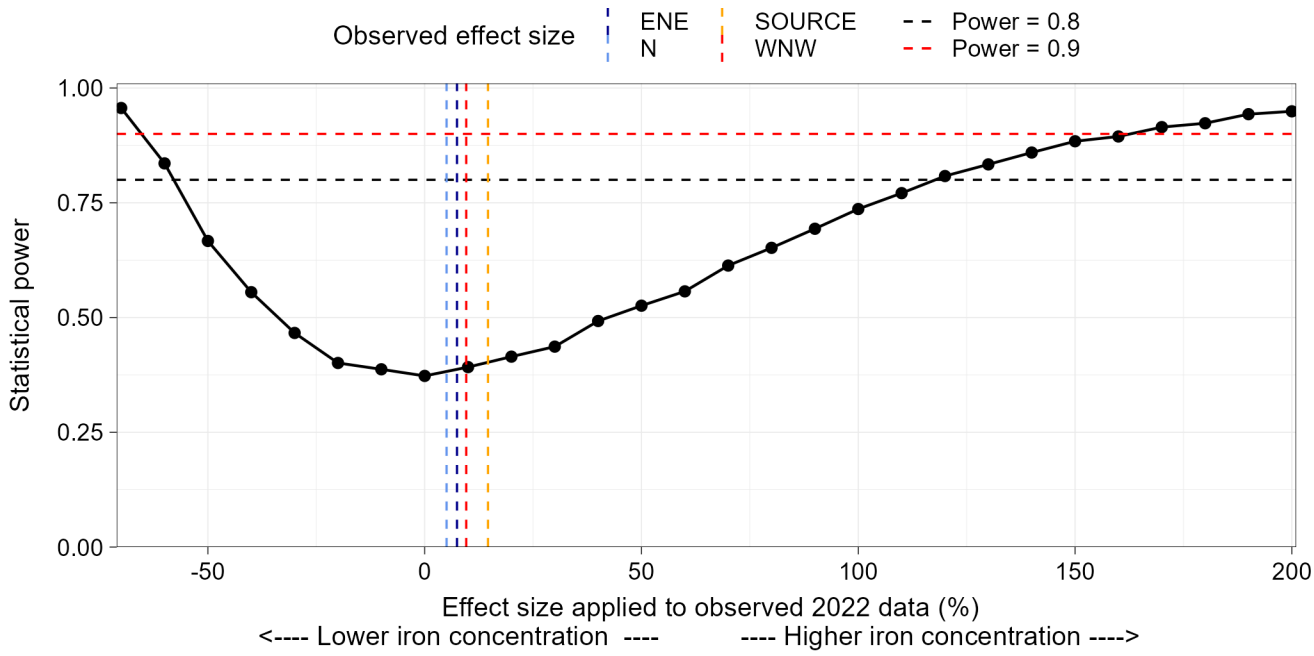

Figure 2: Statistical power of the 2017-2023 iron concentration model at MP-05 to detect a significant temporal trend.

Iron Concentrations for the MP-06 Milne Port Site, 2020-2023

The power analysis indicated that the analysis of iron concentration data collected in 2020-2023 had sufficient power (>0.8) to detect a single-year decrease or increase in iron concentrations at effect sizes of -60% and +150%, respectively (Figure 3). Observed effect sizes (comparisons between 2022 and 2023 values) were -84% for ENE, +14% for N, -24% for Source, and -39 for WNW. Power to detect the observed effect sizes was high for ENE, but low for the remaining three sites, to the higher variability compared to ENE data. This is consistent with the finding of a statistically significant difference between 2022 and 2023 for ENE but no other significant differences between years (Section 2.4.2.3 in the 2023 MEEMP main report [WSP 2024]).

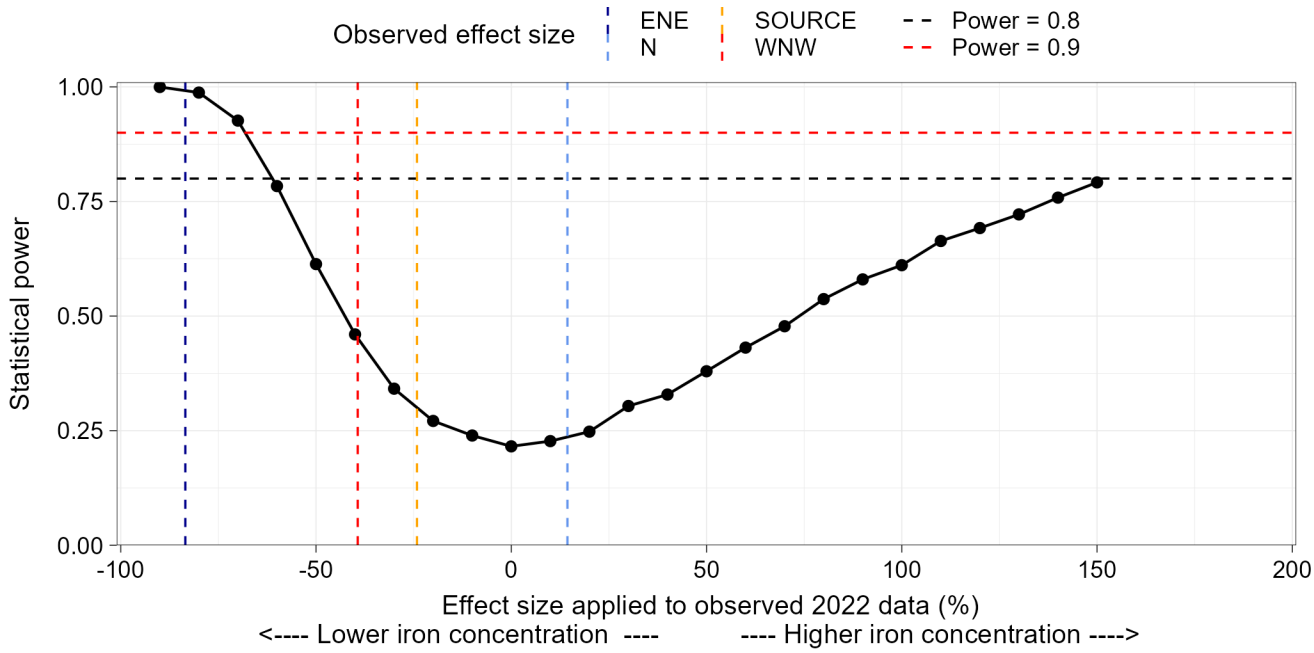

Figure 3: Statistical power of the 2020-2023 iron concentration model at MP-06 to detect a significant difference between 2022 and 2023 data.

POWER ANALYSIS – SUMMARY

Summary of Findings

- Iron concentrations, MP-05 – there was sufficient power to detect a single-year decrease or increase in iron concentrations at effect sizes of -60% and +120%, respectively.
- Iron concentrations, MP-06 – there was sufficient power to detect a single-year decrease or increase in iron concentrations at effect sizes of -60% and +150%, respectively.

Overall, the results of the power analysis presented here indicate that analyses of iron concentrations in at MP-05 and MP-06 data had low power to detect effect sizes that would be large enough to be ecologically relevant. Therefore, the temporal effects should be assessed using effect sizes rather than a strict adherence to statistical significance.

3.0 SEDIMENT QUALITY

3.1 Introduction

This chapter presents the results of the marine sediment quality monitoring program, a component of the larger Marine Environmental Effects Monitoring Program (MEEMP) conducted within the vicinity of Milne Port in Milne Inlet, during the 2023 open-water season. The 2023 MEEMP sediment sampling program was focused on sampling at the East, Northeast, Northwest, and West transect stations based on the radial transect study design last implemented in 2020 (Golder 2021).

This component was developed in consideration of the monitoring requirements outlined in the Project Certificate (PC) Conditions described in Chapter 1.0, Table 1-2. PC No. 005 Conditions related to the monitoring include PC Conditions No. 76, 83(a), 84, 85, 87, and 99(a).

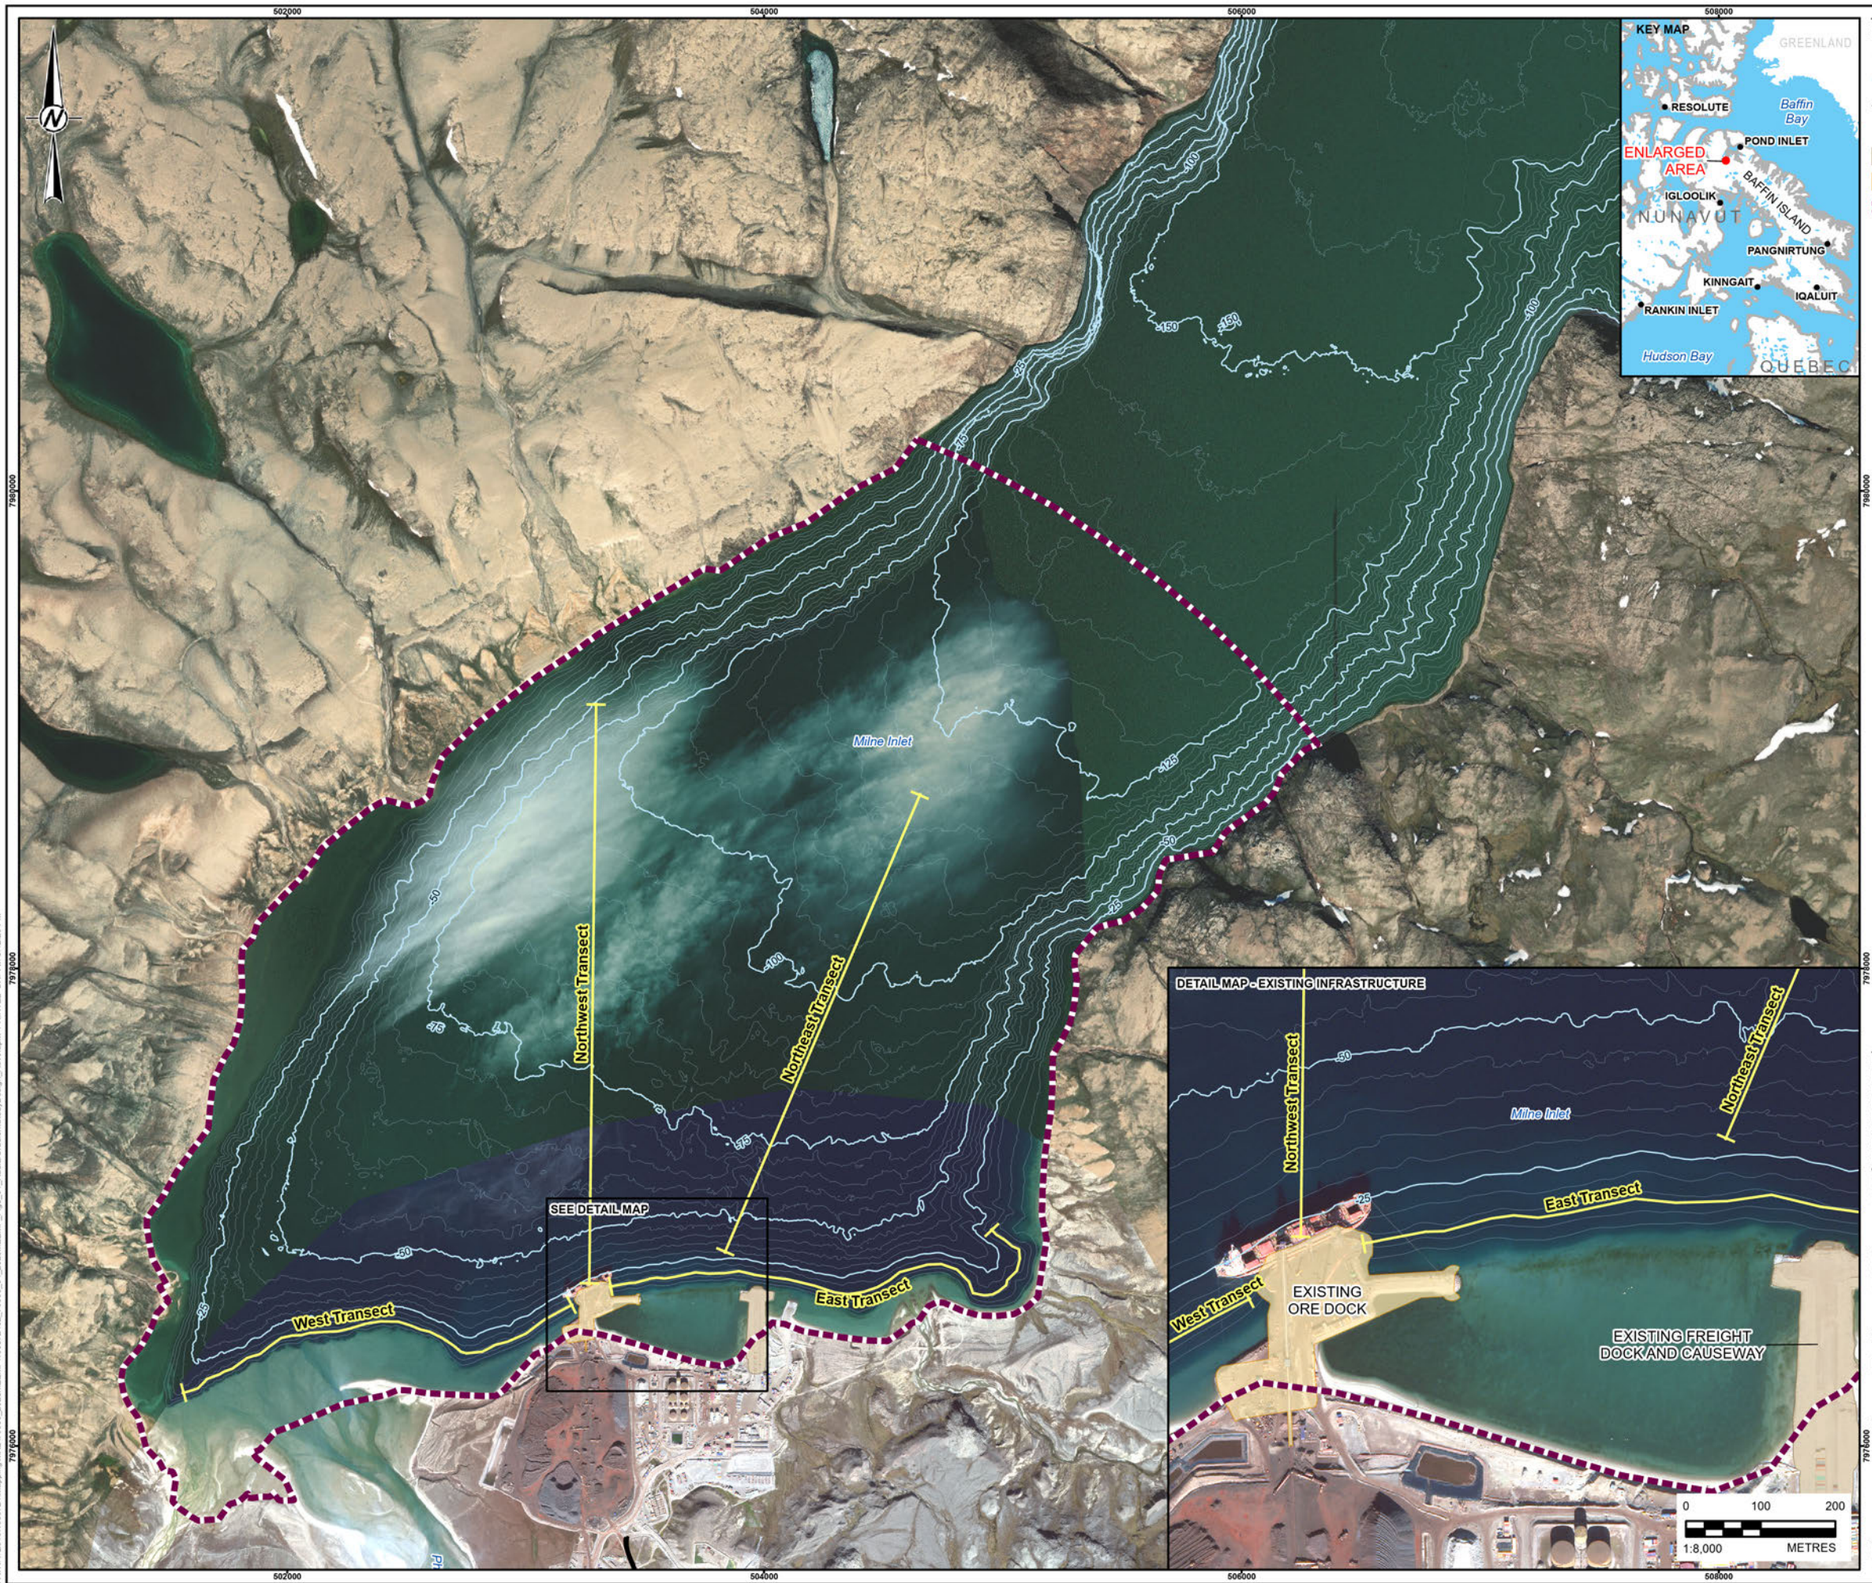
3.1.1 Objectives

The MEEMP objectives are outlined in Section 1.3 of Chapter 1.0 (Program Overview). The objectives specific to the 2023 sediment quality program are:

- Characterize and interpret marine sediment quality in Milne Port for the purpose of identifying Project-related effects.
- Verify predictions made in the Final Environmental Impact Statement (FEIS; Baffinland 2012, 2013) and other submissions to the Nunavut Impact Review Board (NIRB) regarding effects on sediment quality, as applicable.
- Characterize marine sediment quality to support interpretation of the benthic infauna component along the East, Northeast, Northwest, and West transects.
- Collect sediment samples at non-transect stations added to the MEEMP in 2023 to characterize sediment quality under existing conditions to support the assessment of Project-related effects due to the use of larger ore vessels (Baby Cape and Capesize) at Milne Port.
- Recommend any necessary and appropriate changes to the sediment quality component of the MEEMP for future years.
- Involve Inuit in the marine sediment quality monitoring program and include protocols that are responsive to Inuit concerns.

3.2 Study Design

3.2.1 Background



In the 2020 MEEMP Report, Golder (2021) reported that monitoring results to date have not identified Project-induced changes to sediment quality in the marine receiving environment. After three consecutive years of implementation, the joint radial benthic and sediment sampling program was moved from an annual to a three-year cycle. The revised monitoring frequency was more comparable with the Federal Metal Mining Environmental

Effects Monitoring Program and was commensurate with the lack of directional trends observed from 2014 to 2020 that indicated the Project had not adversely impacted marine sediments in Milne Inlet.

In 2020, station SW-2 was identified as a potential anomaly due to coarser sediment composition and reductions in benthic infauna indicators relative to other coastal stations along the West Transect. To determine whether Project activities contributed to these differences, targeted sediment quality and benthic infauna sampling was performed at station SW-2 in 2021 and 2022, with the addition of sampling at adjacent West Transect stations SW-1, SW-3, and SW-4 in 2022. The additional stations were added in 2022 to better characterize natural variation across a wider area along the West Transect and, hence, contextualize results. The targeted sediment quality programs in 2021 and 2022 indicated that sediment quality parameters at SW-2 (Golder 2021) and SW-1 to SW-4 (Golder 2022) along the West Transect stations were consistent with previous MEEMP years: concentrations of metals and hydrocarbons were below applicable Canadian Council of Ministers of the Environment (CCME) sediment quality guidelines, and the data do not suggest Project-related impacts. However, particle size results at SW-2 in 2021 indicated changes in sediment particle size was consistent with expected effects of propeller wash in Ore Dock area and that particle size along SW-1 to SW-4 were variable as expected and driven by natural factors such as ice movement and coastal sediment processes. Overall, monitoring results during the targeted sediment sampling programs in 2021 and 2022 remained within predictions for the FEIS and subsequent addenda (Baffinland 2012, 2013).

In 2023, the full sampling program was conducted based on the adjusted monitoring frequency of every three years, 2020 being the last year the full joint sediment and benthic program was sampled. In short, the radial study design involves sampling at 15 stations per transect, which are co-located with benthic infauna stations to allow for evaluation of exposure data (sediment quality) in relation to biological variables (benthic infauna community characteristics) (Golder 2021; Figure 3-1). As per the 2020 sediment sampling program, the two Coastal Transects (East and West) and the two Northern Offshore Transects (Northwest and Northeast) are described below:

- *East and West Transects*: arranged along the 15 metre (m) depth contour to minimize the confounding influence of water depth on sediment and associated biota. The 15 m depth contour is considered to be unaffected by winter ice scour and has been associated with relatively higher species counts and increased species diversity for both marine flora and fauna (SEM 2015). The East and West Transects extend approximately 1,500 m to the east and the west of the Ore Dock area, respectively.
- *Northwest and Northeast Transects*: extend directly offshore from the existing Ore Dock area, out to a distance of 2,000 m, corresponding with water depths of approximately 100 m and 120 m. These transects include both distance and depth gradients for consideration in the analysis, such that both distance and depth along a transect represent potential confounding factors in the evaluation of potential effects on sediment quality from the Project.

3.2.2 Modifications to the Program (2023)

The radial transect sampling program was designed such that 15 stations along each of the four transects (East, West, Northwest and Northeast) were to be sampled for sediment quality according to a gradient sampling design. While this was achieved in 2020, in 2023 a total of 41 stations out of the intended 60 stations were sampled due to logistical and time constraints. The sediment sampling program is one of several sampling programs that are safely implemented within a short open water season given the northern latitude of Baffin Island. Stations were sampled along each of the four transects to optimize spatial coverage in the time available and the number of stations sampled was considered in the data analysis and interpretation.

Two new sampling stations, SCV-1 and SCV-2 located West of the Ore Dock area were added to the 2023 program. These two stations were collected as part of the existing conditions sampling program to account for Capesize vessels arriving in Milne Inlet for the first time. This sampling program is further discussed in Section 3.2.3.

3.2.3 Capesize Vessel Existing Conditions Sampling Program

In 2023, NIRB accepted the Sustaining Operations Proposal and issued Amendment 5 of Project Certificate 005. Under Amendment 5, Term and Condition 83(a) required Baffinland to update the marine sediment quality program to reflect the increased use of larger ore vessels at Milne Port. Baffinland committed that stations SW-1 through SW-4, SE18-1, SNW-1, and two new stations (SCV-1 and SCV-2) would be monitored for scouring effects on sediment and benthic infauna for three years after the initial use of large (Baby Cape and Capesize) ore carriers in fall 2023 (Commitment 10, SOP Technical Comment QIA ME-7(3); NIRB, 2023). Following this three-year period, Baffinland will consider a reduced frequency in sampling at these locations (once every three years) if sediment and benthic conditions at these sites are shown to be stable and within the limits of impact predictions. As the initial Capesize ore carrier use in Milne Port was planned to take place in the late ice-free period of 2023 (29 August 2023), sampling for Capesize vessel effects monitoring commenced in August 2023 (August 4-19, 2023) with the intention of documenting existing conditions for sediment quality prior to the use of the larger vessels.

Three of the stations to be monitored for Capesize vessel impacts are in addition to the 60 stations sampled under the radial sampling design. The three stations are SE18-1, which was established in 2019 to maintain consistency with previous MEEMP programs (i.e., previous sediment station SE-1) and the two new stations established in 2023 specifically for Capesize vessel impacts monitoring (SCV-1 and SCV-2). Sediment quality parameters measured as part of the Capesize Vessel Existing Conditions Sampling Program included moisture, pH, particle size, organic carbon, metals, polycyclic aromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, and xylene (BTEX), volatile organic compounds (VOCs), and petroleum hydrocarbons (PHCs).

3.2.4 Sampling Parameters and Indicators

For marine sediment quality, parameters measured included particle size, organic carbon, nutrients, metals, PAHs, BTEX, and PHCs. A sub-set of these parameters (i.e., percent fines, nutrients, metals, and hydrocarbons) were identified as sediment quality indicators to assess the potential for environmental effects from the Project. To provide early warning of environmental effects from the Project, applicable sediment quality guidelines were used as thresholds, where they exist (i.e., CCME sediment quality guidelines for the protection of aquatic life in marine

environments [CCME 1999]). For indicators of particular concern for the Project, with no applicable sediment quality guideline (i.e., percent fines and iron), data were analyzed statistically to evaluate Project-related effects within the Milne Inlet study area. The purpose of the radial transect design adopted for the sediment and benthic MEEMP surveys is to assess sediment quality and benthic invertebrate communities over time, and relative to previous years, in order to evaluate the potential for Project-related effects on these indicators. Overall trends in percent fines and iron are evaluated both spatially and temporally in the sediment assessment.

Along with several other components of the MEEMP, the marine sediment quality monitoring program has indicators, thresholds and risk categories that are part of Baffinland's Trigger Action Response Plan (TARP), an adaptive management process. The TARP uses effect indicators that are measured against a series of tiered thresholds (i.e., low, moderate and high-risk thresholds) that are designed to guide short-term and long-term adaptive management strategies as outlined in Baffinland (2023). Baffinland has updated the TARP as part of the revised draft Marine Monitoring Plan (MMP) (Baffinland 2023). The pre-defined actions identified in the TARP describe the responses that Baffinland would implement should the corresponding threshold levels be exceeded and assuming there is some degree of certainty that the measured change is Project-related. As adaptive management is beyond the scope of the present report, only the indicators, risk categories and thresholds are presented here (section 3.3.4).

3.3 Materials and Methods

3.3.1 Field Methodology

In addition to the 41 transect stations sampled as part of the 2023 MEEMP, a sediment sample from one additional station (SE18-2) was collected and submitted for chemical analyses (Table 3-1; Figure 3-2). This station was included for consistency with previous MEEMP programs but was not part of the updated radial gradient sampling design, and so it is not subject to the same analysis and interpretation. In total, 45 sediment quality samples (41 transect stations, three Capesize stations [SE18-1, SCV-1, and SCV-2] and SE18-2) plus four duplicates were collected for sediment chemistry analysis.

Table 3-1: MEEMP Sediment Quality Stations at Milne Port (2023)

Station Name	UTM Coordinates (Zone 17W)		Approximate Lateral Distance Along Transect (m)	Water Depth (-m below Chart Datum (m)[1]
	Easting	Northing		
East Transect

Sediment samples were collected using a standard Van Veen grab sampler (area of 0.1 m^2). Each grab sample was examined for acceptability based on the following criteria:

- The sampler was fully closed.
- There was adequate penetration depth (i.e., sediment volume greater than 25% full).
- The sample did not appear overfilled or disturbed, and the sample did not appear to have been collected on an angle.
- The sampler did not appear to be leaking sediment at a substantial rate (i.e., the top of the sediment profile did not appear to be sloping inwards).

Upon acceptance, the overlying water in the grab was removed using a siphon tube or turkey baster, taking care to minimize the loss of sediment from the surface of the grab contents. After decanting, the sample consisted of sediment with minimal overlying water visible. For each sample collected, two terra core samples were taken from the undisturbed sediments and placed into pre-labeled methanol preserved vials for VOCs and/or BTEX. A description of the sediment with respect to colour, particle size, depth of sediment horizon sampled, grab penetration depth and presence of non-sediment materials (e.g., shells, debris, biota) was recorded on the sediment collection log. Prior to the sample collection, a stainless-steel spoon and bowl were cleaned with laboratory-grade detergent and rinsed with de-ionized (analyte-free) water. The remaining top 5 centimetres (cm) of sediment from the grab sample was removed from the center of the grab using a stainless-steel spoon and transferred to a stainless-steel bowl. The sediment was then homogenized, and aliquots transferred to clean, laboratory supplied sampling containers.

Physical and chemical parameters were analyzed in sediment samples collected from a total of 41 stations along four transects in Milne Inlet, as well as four additional non-transect locations (SE18-1, SE18-2, SCV-1, and SCV-2) and field duplicate quality control (QC) samples collected from four randomly selected stations (approximately 10%) of the total number of stations. Photographs were taken of each sample in the grab and homogenized (Appendix 3A).

Sediment samples were sent to ALS Canada Ltd. (ALS) for analysis of the following parameters:

- Particle size distribution (Wentworth scale [Wentworth 1922]), moisture
- Organic and inorganic carbon
- VOCs (Capesize Vessel Stations only) and/or BTEX
- PHCs F1-F4 and PAHs
- Metals (including mercury), and pH

3.3.2 Data Analysis

The physical composition of sediments from stations located along the four transects and at the non-transect stations was characterized and sediment quality parameters were screened against applicable sediment quality guidelines. A Principal Component Analysis (PCA) was performed on the radial transect stations to investigate the relationship between measured physical and chemical parameters. To address the objectives outlined in Section 3.1.1, further statistical evaluation of marine sediment quality focused on the distribution of fine sediments and iron concentrations along the four transects. Iron is of primary importance because of the potential for increased deposition of iron ore in the form of dust or in runoff from storage stockpiles, generated from the Project. An increase in iron content over time in Milne Inlet sediments could represent a Project-related effect due to the potential for release of iron ore in the form of dust, stockpile runoff, or during loading of ore onto vessels at the Port. Given that the iron ore consists primarily of iron (>65%; FEIS; Baffinland 2012, 2013), monitoring for changes in the concentration of this element in marine sediments is an important component of the MEEMP.

There is no iron marine sediment quality guideline in Canada. Sediment data for iron and percent fines were evaluated spatially and temporally along the transects using modeling.

3.3.2.1 Comparison to Sediment Quality Guidelines

Analytical results were compiled, and parameter concentrations compared to applicable sediment quality guidelines. Concentrations of metals and hydrocarbons were compared to CCME ISQGs and Probable Effect Level (PELs) for the protection of aquatic life in the marine environment (CCME 1999), applicable within the Project jurisdiction. The CCME ISQGs are intended to represent concentrations below which adverse biological effects are rarely expected to occur. By comparison, the CCME PELs are intended to represent concentrations above which adverse effects are predicted to occur frequently, based on a concurrence data set with sediment chemical concentration and benthic invertebrate effects data from other sites. Notably, the Federal Contaminated Sites Action Plan (FCSAP) guidance for working harbours (FCSAP 2021) recommends use of PELs over ISQGs for screening primary contaminants of potential concern (COPCs), as screening with ISQGs is considered overly conservative and does not always correlate well with observed effects under field conditions (FCSAP 2021).

To provide a screening value to inform the sediment evaluation, in the absence of a CCME guideline, metals and hydrocarbons were compared to British Columbia (BC) Working Sediment Quality Guidelines (WSQG) (British Columbia Ministry of the Environment and Climate Change Strategy [BC MOE] 2021), and the National Oceanic and Atmospheric Administration (NOAA) sediment benchmarks (Buchman 2008).

3.3.2.2 Principal Component Analysis (PCA)

The PCA is an ordination technique that examines ecological distances (differences or similarities) between samples and allows plotting of high dimensional data in two or three-dimensional graphs, with the distances between the samples in the graphs representing the degree of similarity or difference in chemistry indicators. Essentially, a PCA takes a large data set (in this case, sediment chemistry data) and reduces it to a small number of variables (i.e., principal components) that characterize the variability inherent in the data set. The magnitude of concentration is less important than variability in the analysis, which makes PCA useful to evaluate spatial patterns that could otherwise be missed because of the influence of stations with highly variable sediment parameters.

For this assessment, a PCA was undertaken to evaluate the following:

- Whether there is an association between metal concentrations measured in the sediments and distance from the Ore Dock area in the 2023 sediment program. Any direct impacts on sediment quality resulting from Port operations (i.e., prop wash scouring, ore dust, hydrocarbon leaks, wastewater, and site runoff) would be greatest within the vicinity of the Ore Dock area, with direct effects progressively decreasing with distance away from the Ore Dock area.
- The relationship between sediment physical and chemical data collected during the 2023 field program. Metals, in general, tend to accumulate to a greater degree in finer sediments due to a combination of physical (e.g., increased surface area to volume ratio) and chemical (e.g., geochemical substrate) factors (Jones and Bowser 1978; Horowitz 1991).

The PCA was conducted on sediment physical and chemical parameters measured in sediment samples collected from the four transects. Parameters with a high frequency of data below detection limit (DL) (i.e., >20%) were excluded from the PCA. For parameters with a low frequency of data below DL (i.e., <20%), any values reported as below DL were replaced with the DL value. In addition, highly correlated parameters (e.g., total organic carbon and organic matter content) were identified and reduced such that only one parameter was included, in order to reduce collinearity in the dataset. As sediment parameters were measured on different scales (i.e., log-scale [pH], percent [particle size], concentrations [metals]), values were transformed to z-scores (also known as scaling, or scaling and centering; i.e., $z = \frac{value - mean}{standard\ deviation}$) to remove effects of unit differences. The PCA was conducted in the statistical environment R v.4.0.3 (R Core Group 2023), using the package FactoMineR (Le et al. 2008).

3.3.2.3 Spatio-temporal Statistical Models

Sediment fines composition was evaluated further statistically because metals tend to accumulate to a greater degree in finer sediments as a result of both physical and chemical factors (e.g., increased surface area to volume ratio). Additionally, iron concentrations in sediment were further analysed statistically because iron has been raised as a concern to local Inuit due to the potential for increased disposition of iron ore in the form of dust or in runoff from storage stockpiles because of the Project. Therefore, both parameters were evaluated further using spatio-temporal statistical models.

The use of regression analyses to analyse the transect data for sediment fines and iron concentrations required the use of a distance variable as a predictor in the spatio-temporal models. Prior to 2020 (Golder 2021), distance from the Ore Dock area was used; however, in line with analysis performed after the collection of 2020 data to standardize the values and improve interpretation, a single origin point was used for spatio-temporal modelling. This point (the transect origin), an imaginary intersection between the East, West, and Northwest transects, was determined to be at coordinates of -80.905917°, 71.889649°, and was at the center of the Ore Dock area. All distances reported in the analyses were calculated as straight-line distances from each sampling location to this point of origin.

In order to account for nonlinear relationships between response variables and distance from transect origin, as well as year (for the Entire Dataset analyses), these variables were modelled using natural splines, a form of non-linear regression. The number of spline knots was determined using Akaike information criterion (AIC), where models with the lowest AIC was selected as the preferred model. Statistical outliers and influential points were identified and removed during the analysis but were shown on the plots depicting raw values and model predictions for transparency. Following regression analysis, multiple comparisons were performed to assess differences in modelled variables among years at select distances along the transects. These multiple comparisons were performed at distances of 250 m, 500 m, 1,000 m, and 1,500 m along each transect for each year, as applicable based on the length of the transect. In addition, where year was modeled as a categorical variable (Post-2018 Dataset), multiple comparisons, with familywise p-value adjustments, were performed at each distance across sampling years, in order to evaluate temporal variation in response variables at distance.

The analyses were performed in the statistical environment R v.4.3.2 (R 2023), using the packages “car” (Fox and Weisberg 2019), “emmeans” (Lenth 2020), and “glmmTMB” (Brooks et al. 2017).

Fines Content in Sediment

Fines content (i.e., sum of clay and silt fractions) was analyzed separately for the radial transect ‘Post-2018 Dataset’ (i.e., 2019, 2020 and 2023) and the ‘Entire Dataset’ (i.e., 2014–2020 and 2023) to assess spatial and temporal gradients.

Both models included the main effects of distance from the Ore Dock area, year, transect, and all possible interactions between the three variables. The effect of distance was modeled as a natural cubic spline with three degrees of freedom, to account for the non-linearity in percent fines relative to distance from the Ore Dock area. While previously the effect of year was analyzed as a categorical variable (Golder 2021), given that eight years of data were available in the Entire Dataset, the effect of year was included as a continuous variable, modeled as a spline, to account for the nonlinear trends over time. In the Post-2018 Dataset, year was modeled as a categorical variable, similar to the analysis performed previously (Golder 2021). Model fit was assessed via diagnostic and residual plots using the DHARMa package (Hartig 2019).

Following both regressions, the significance of spatial and temporal trends was assessed using the package emmeans (Lenth 2020). Specifically, the significance of slopes of the spatial trendlines was assessed along each transect in each sampling year, in 10 m increments (alpha = 0.05). The significance of temporal trends was estimated for each sampling year at distances of 250 m, 500 m, 1,000 m, and 1,500 m along each transect.

Sediment Iron Concentrations

The analysis of iron sediment concentrations was performed in a similar manner to the analysis of fines content. However, in the case of iron, a general linear model was used. To account for the strong relationship between fines content and iron concentrations, fines content (percent fines) was added as a covariate in the analysis. Similar to the analysis of fines, the effects of distance and year (as a continuous variable in the Entire Dataset analysis) were modeled as natural cubic splines with three and four degrees of freedom, respectively. In the model of the Post-2018 Dataset, year was modeled as a categorical variable, similar to the analysis performed previously (Golder 2021).

Following both linear regressions, the significance of spatial and temporal trends was assessed using the package emmeans (Lenth 2020). Specifically, the significance of slopes of the spatial trendlines was assessed

along each transect in each sampling year, in 10 m increments (alpha = 0.05). The significance of temporal trends was estimated for each sampling year at distances of 250 m, 500 m, 1,000 m, and 1,500 m along each transect.

In all prediction plots, the mean value of fines content for the respective transect (and year, where applicable) was used to calculate predicted values of iron concentrations. That is, the predictions represented fines-adjusted iron concentrations (where the fines value used was the average for each transect and year). Hence, predicted trends shown on the plots may not match observed values, since iron concentrations are influenced by fines content, and observed values would vary in the fines content.

3.3.2.4 Inverse Distance Weighting (IDW) of the Distribution of Fine Sediments and Sediment Iron Concentrations

An Inverse Distance Weighting (IDW) interpolation method in ArcGIS was used to create figures to provide a visual depiction of the spatial variability in fine sediments and sediment iron concentrations across the study area, as informed by the results of the radial study design in 2023. IDW is a deterministic interpolation method that assumes the variable being interpolated decreases in influence (its weight) with increased distance from its sample location, or the reverse, that an interpolated value is most influenced by the known sample(s) closest to it.

3.3.3 Quality Management

Of primary importance to the sediment sampling program was the collection of reliable data, which was achieved through the consistent application of Quality Assurance / Quality Control (QA/QC) measures. These quality management procedures were applied to the field collection, data analysis, and reporting tasks for the sampling in 2023 to verify that the data presented are valid and of acceptable quality to objectives outlined in Section 3.1.1.

3.3.3.1 Field QA/QC

Field staff were trained to be proficient in standardized sampling procedures, data recording using standard forms, and equipment operations applicable to the monitoring program. Field work was completed according to specified instructions and established technical procedures for standard sample collection, preservation, handling, storage, and shipping procedures.

General QA/QC tasks applicable to the sediment quality program included, but were not limited to, the following:

- Preparing geo-referenced field maps for use during the surveys to accurately document sampling locations and project-specific data collection forms to standardize the field data collection process.
- Maintaining regular communications between the Project Manager and field staff.
- Collecting and processing samples by qualified experienced personnel.
- Placing samples in appropriate clean containers in such a way that no foreign material was introduced to the sample and handled carefully so there would be no loss of material.
- Collecting QC (duplicate) samples in the field. Specifically, four field duplicates were collected to represent at least 10% of the total number of collected samples.

- Rinsing and filtering equipment including the Van Veen grab sampler, materials collection totes, field splitter and sieves with seawater between stations. Visual inspection confirmed that materials were not retained on equipment before use on the next station.
- Checking and validating field survey data sheets before leaving the station.
- Selecting accredited laboratories for sample analysis. Performance quality of selected laboratories was verified through WSP's internal vendor approval and assessment procedures.
- Using chain-of-custody documentation to track sample shipments to the individual subcontractor laboratories.
- Packaging and shipping samples to the laboratory in accordance with required holding times and storage conditions.

3.3.3.2 Laboratory and Data Analysis QA/QC

Laboratory QA/QC reports were reviewed upon receipt to confirm adherence to sample hold times and laboratory data quality objectives (DQOs), and that the appropriate QA/QC information had been reported. Laboratory QA/QC included verification of recommended sample holding times and the analysis of laboratory control samples, laboratory duplicates, and spiked samples to assess precision and accuracy of analytical methods.

Field duplicates were sampled from four randomly selected samples (approximately 10% of total number of samples collected). Field duplicates were sampled as a 'split sample' from the same discrete homogenized grab sample as the 'original' sample and identified as Duplicate A, C, D, and E (blind samples). To assess variability between field duplicates, the Relative Percent Difference (RPD) was calculated as follows:

$$RPD = \left(\frac{sample - duplicate}{(sample + duplicate)/2}\right) \times 100$$

In accordance with the BC Field Sampling Manual (BC ENV 2023) and CCME (2016), an RPD value of >50% was used to identify notable differences between original and duplicate samples. Values less than five times the Method Detection Limit (MDL) were not included in the RPD calculations because analytical variability near the MDL is higher and does not provide a reliable measure of variability associated with the collection of field samples.

3.3.4 TARP Assessment

As part of applying the Trigger Action Response Plan (TARP) sediment quality performance indicators were screened against condition status/thresholds in 2023, in order to assess risk levels for each performance indicator (Table 3-2).

Table 3-2: Marine Environment TARP Framework for Sediment Quality

Component	Performance Indicators	Condition Status/Threshold		
		Low Risk	Moderate Risk	High Risk
Sediment Quality	• Particle Size • Nutrients • Metals • Hydrocarbons	Measured concentrations of a parameter at one or more stations are > the CCME[1] ISQG or another relevant lower bound guideline, and are higher than background concentrations. AND Spatial and temporal sediment trend analysis suggest a pattern indicative of Port-related effects beyond FEIS[2] predictions.	Measured concentrations of a parameter at one or more stations are > the CCME PEL or another relevant upper bound guideline[1]. AND Spatial and temporal sediment trend analysis suggest a pattern indicative of Port-related effects beyond FEIS[2] predictions. AND Sediment toxicity testing as a special study indicates a Port-related effect.	To be determined based on outcome of moderate response investigations.

[1] Canadian Council of Minsters of the Environment (CCME 1999) sediment quality guidelines for the protection of marine aquatic life. ISQG = Interim Sediment Quality Guideline; PEL = Probable Effect Level.
[2] Baffinland 2012, 2013.

3.4 Results

Representative photographs and field data sheets from the field program are provided in Appendix 3A and Appendix 3B, respectively. Analytical laboratory reports are provided in Appendix 3C, and the compiled dataset for both the radial transect stations and the non-transect stations screened to applicable sediment quality guidelines are provided in Appendix 3D, and the QA/QC results are provided in Appendix 3E.

The particle size composition and comparison to sediment quality guidelines for the Capesize vessel stations are presented in Section 3.4.6. These include both transect and non-transect stations.

3.4.1 Sediment Particle Size Composition

The physical composition of sediments differed among stations and transects in 2023 (Figure 3-3). Sediment from the East (SE) and West (SW) transects consisted of a mix comprised primarily of sand and silt, while the Northern Offshore Transects (SNE and SNW) sediment consistently had higher proportions of fines (i.e., silt and clay). Proportions of fines appeared to increase with distance from the Ore Dock area for the Northeast Transect while the proportion of fines in the Northwest Transect was more uniform with distance from the Ore Dock area. These observations were consistent with 2020 and previous MEEMP years, with the observed overall difference in physical grain size distributions between coastal and offshore sediments expected. However, compared to the

proportion of fines in 2020 (34% to 78%), the proportion of fines at the Northwest Transect was generally lower in 2023 (43% to 69%), and there was only a marginal increase in fines with distance from the Ore Dock area in comparison to the other three transects.

Coastal sediments located at shallower depths tend to be influenced by the nearshore environment and features such as rivers and streams, whereas offshore sediment is more isolated to these influences because they are located in progressively deeper water at a distance from the shore. Overall, there was a decrease in finer sediments along both nearshore transects in 2023 compared to 2020. Offshore sediments are more influenced by internal mixing and sediment redistribution processes such that finer sediments tend to deposit and accumulate in sediments further from shore. Accordingly, in the 2023 program, the proportion of fine-grained sediments tended to increase with distance from the Ore Dock area along the Northeast Transect and was variable along the Northwest Transect. When compared to 2020, there was an overall decrease in the proportion of fines along both offshore transect stations sampled in 2023.

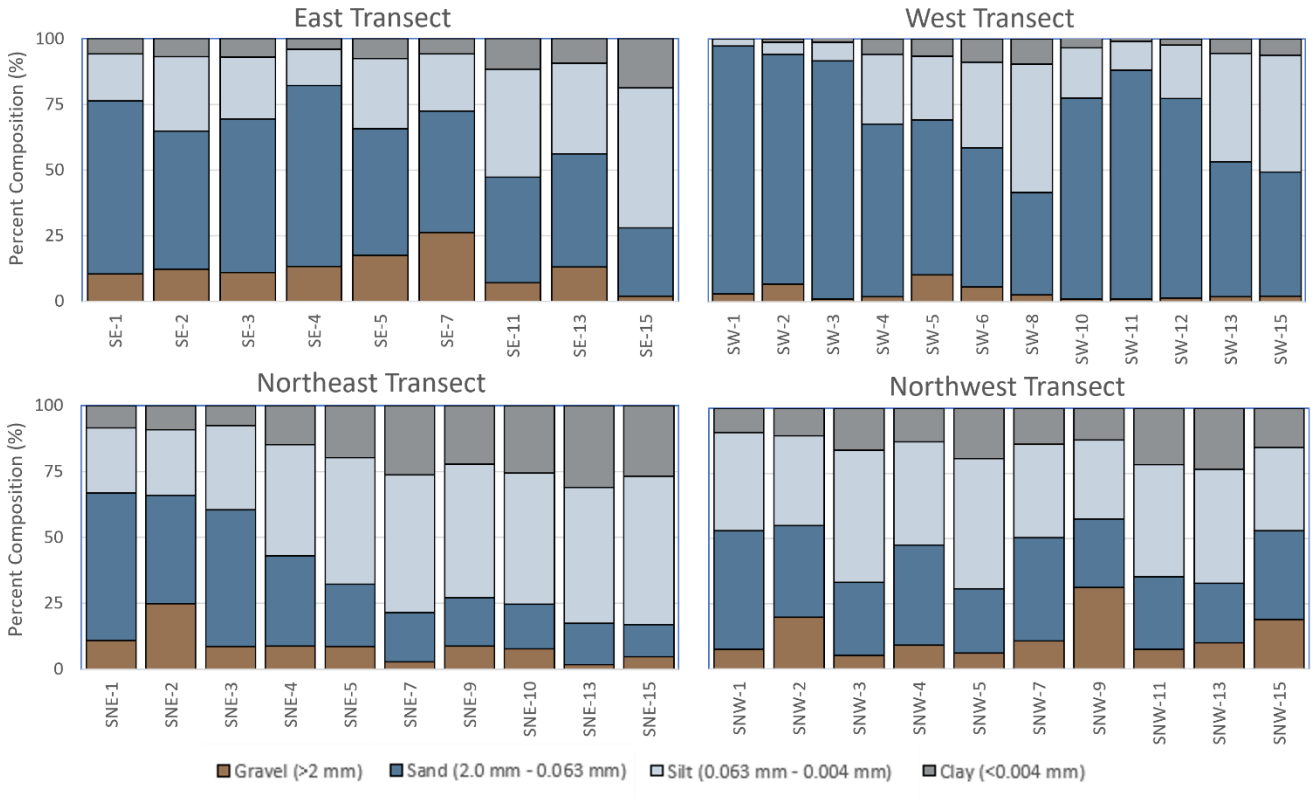

Figure 3-3: Sediment Particle Size Distribution for Stations Located Along Transects Radiating Out from the Ore Dock Area in Milne Port, 2023.

3.4.1.1 Particle Size Composition Stations on the West Transect Closest to the Ore Dock Area

In 2020, station SW-2 was an outlier because of considerably lower fines and higher sand content, in addition to lower benthos density and richness values, compared to other stations along the West Transect in 2020 and previous sampling programs. In 2022, the joint sediment and benthic program focused on targeting sampling at four stations along the West Transect (SW-1 to SW-4) due to the anomalous patterns in sediment and benthic infaunal indicators documented in 2020 at SW-2, relative to other stations along the West Transect. As mentioned in Section 3.2.1, results from the targeted sampling programs indicated there was no evidence of Project-related impacts to sediment quality at SW-2 and other West Transect stations.

In 2023, stations SW-1 through SW-4 were sampling as part of the radial benthic and sediment sampling program. Particle size results at these four stations are presented in Figure 3-4. Most stations along the West Transect and closest to the Ore Dock area are comprised, predominantly, of sand (i.e., >60%) since 2019. Percent fines has steadily decreased over time except at Station SW-4 where fines composition has been more stable. SW-1 and SW-2 have shown a decrease in fines in 2022 and 2023 compared to 2019 and 2020.

Overall, monitoring results during the targeted sediment sampling programs in 2021, 2022 and 2023 remained within predictions for the FEIS and subsequent addenda (Baffinland 2012, 2013).

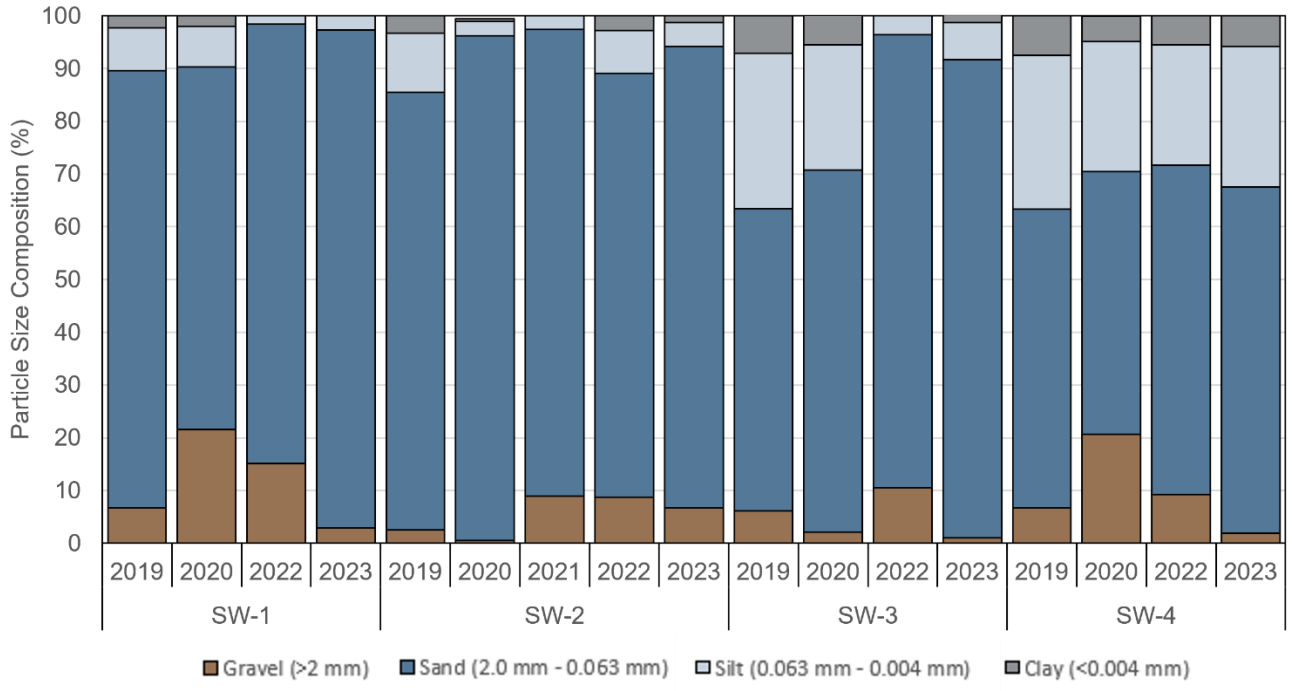

Figure 3-4: Sediment Particle Size Distribution for Stations SW-1 through SW-4 (i.e., Stations Closest to the Ore Dock Area) Located along the West Transect, Milne Port 2019-2023.

3.4.2 Spatial Relationships between Sediment Parameters

The results of the PCA shown in Figure 3-5 for sediment data collected in 2023 showed strong linear relationships between sediment metal concentrations and the proportion of fine-grained sediments such as silt (particle size of 0.004 millimetres [mm] – 0.063 mm) and clay (particle size of <0.004 mm) and less with sand and gravel. The PCA showed three components with eigenvalues >1 that accounted for 91.4% of the total variance. The first component (PC1) explained the highest percentage of the variance in the original data (83.5%). The other two principal components accounted for the remaining 7.9% of the explained variance and will not be discussed further. Details of the PCA, including the eigenvalues, loadings, correlations, and quality of representation are presented in Appendix 3F.

As depicted in Figure 3-5, PC1 positively correlated strongly with fine fractions of sediments (silt and clay), but also with phosphorus (correlation coefficient > 0.88), metals concentrations (correlation coefficient >0.81), and inorganic carbon (correlation coefficient >0.90), and to a lesser extent with total carbon (correlation coefficient > 0.86), moisture (correlation coefficient = 0.87), and molybdenum (correlation coefficient = 0.81). PC1 strongly negatively correlated with sand (correlation coefficient = -0.96) and pH (correlation coefficient = -0.44).

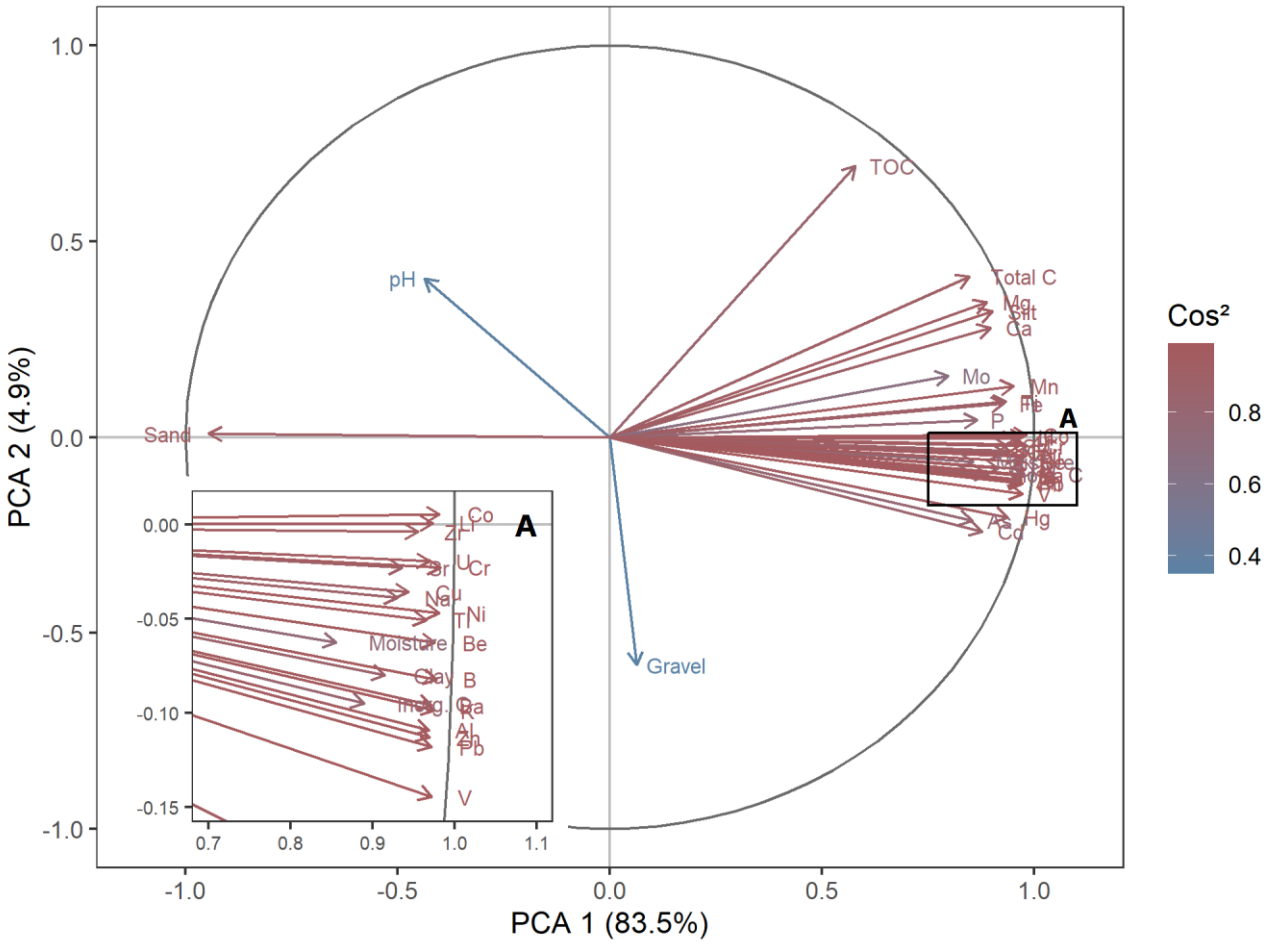

Figure 3-5: Principal Component Analysis (PCA) of Sediment Quality at Stations Along the Transects Radiating Out from the Ore Dock Area in Milne Port (2023).

PC1 and PC2 were plotted to identify where samples lie in two-dimensional ordinal space, allowing for further interpretation of the data (Figure 3-6). The right half of Figure 3-6 represents stations associated with higher silt and clay content, and metals concentrations consisting of mostly of the two Northern Offshore Transect Stations (SNE and SNW) and the left half of the figure represents stations with higher sand content and lower metal concentrations, consisting mostly of the Coastal Transect Stations (SW and SW). Stations along the coastal transects are reflective of shallower environments with a variable mix of sediments (i.e., sand and gravel), and subsequently relatively lower metal concentrations.

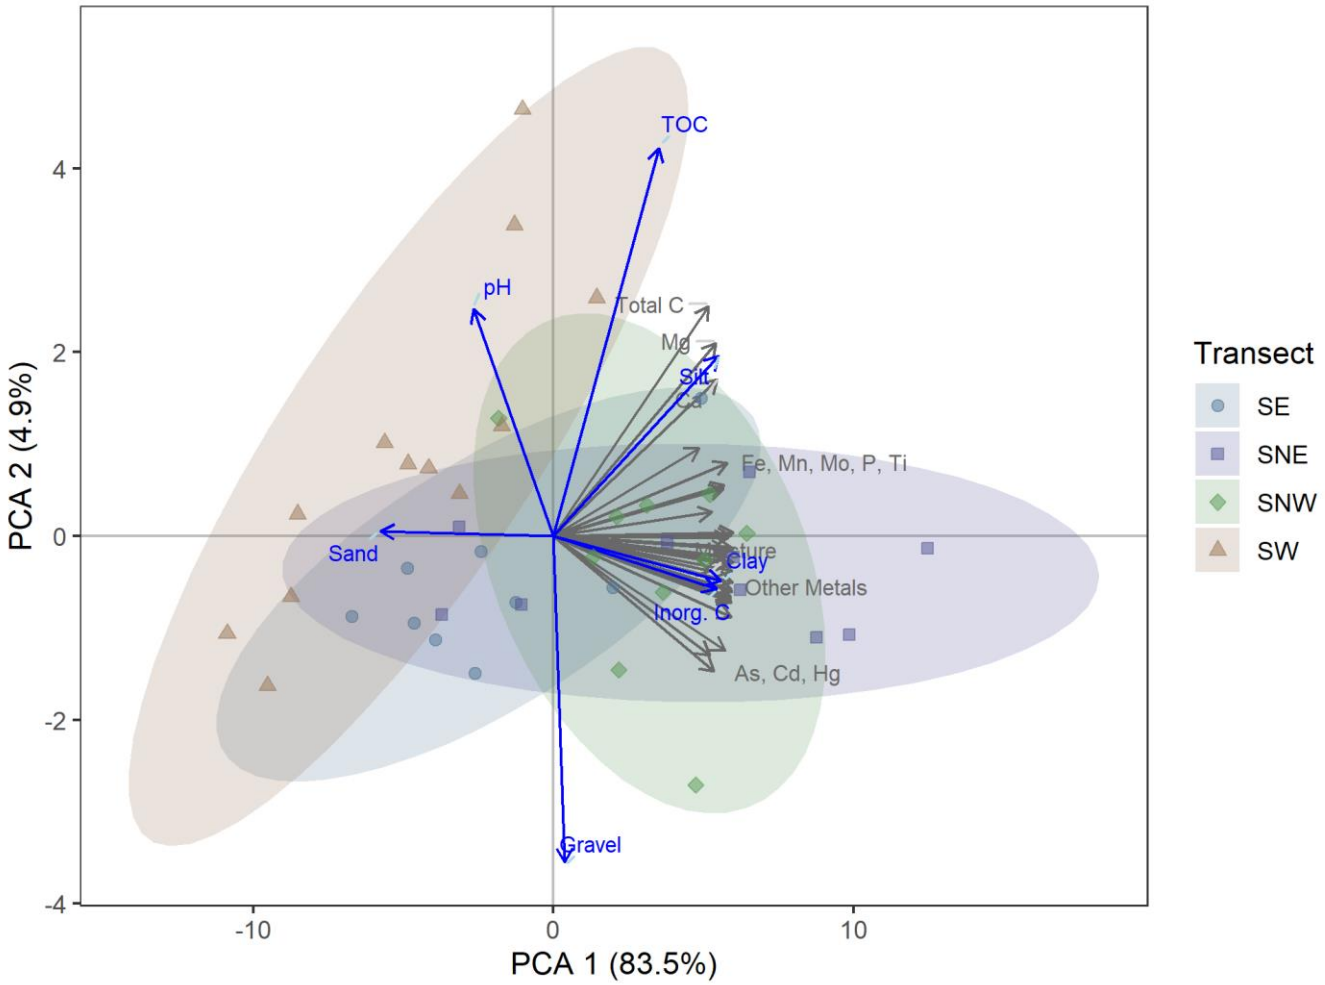

Figure 3-6: Principal Component Scores for Sediment Quality Stations Located Along the Transects Radiating Out from the Ore Dock Area at Milne Port, 2023.

Overall, the results of the 2023 PCA suggested that:

- A clear relationship exists between sediment metal concentrations and the proportion of fine-grained sediments (i.e., silt and clay). Strong linear relationships were also observed between sediment metal concentrations, and the proportion of fine-grained sediments in Milne Inlet during baseline programs (Baffinland 2013; SEM 2014; 2015), and previous MEEMP years between 2014, 2019, and 2020.
- The substrate composition along each transect seems to differ based on natural depositional forces rather than Project activities. Coastal transect stations tend to have more variable sediment compositions (i.e., due to ice scouring, wave actions, currents, coastal topography, and freshwater inputs from Phillips Creek) than deeper offshore transect stations sediments along the Northern Transects.

Metal concentrations in sediments were greater in areas with proportionally more fines which increased with distance from the Ore Dock area (Figure 3-3, Figure 3-5, Figure 3-6). For example, arsenic (Figure 3-7), copper (Figure 3-8), and nickel (Figure 3-9) concentrations generally increased with greater distance from the Ore Dock area particularly along the Northwest and Northeast Transects. Variability in concentrations of these metals and in percent fines was lower along the West and East Transects because they are situated parallel to the coast and samples were collected along the same shallow depth profile.

3.4.3 Comparison to Sediment Quality Guidelines

3.4.3.1 Sediment Metals

Sediment metal concentrations at stations sampled in 2023 were lower than applicable sediment quality guidelines with the exceptions of arsenic, copper, and nickel, as described below for each of the three metals. Measured concentrations and spatial patterns for arsenic, copper, and nickel were well explained by the variability in percent fines, which was shown to increase with greater distance from the Ore Dock area due to natural coastal sorting processes. Therefore, the infrequent low magnitude exceedances of the conservatively derived ISQG in some samples along the Northern Offshore transects are likely reflective of background conditions and related to physical sediment properties (i.e., percent fines due to natural coastal sorting processes), rather than the influence of Port activities. Arsenic, copper, and nickel are not associated with ore processing at Mary River (Baffinland 2012) and are not present in elevated concentrations close to the Ore Dock area, further supporting the likelihood that the observed concentrations reflect regional background concentrations. Concentrations of arsenic or copper in 2023 did not approach their respective CCME PELs in any sediment sample.

Arsenic concentrations were below applicable guidelines along the East and West Transects but were slightly above the conservatively derived CCME ISQG (7.24 milligrams per kilogram [mg/kg]) at seven stations[1] sampled along the two Northern Transects (Figure 3-7) by up to 1.5 times. Concentrations in the seven Northern Transect samples were also marginally above the NOAA T20 benchmark (7.4 mg/kg; Buchman 2008) and five of those samples were marginally above the NOAA Effects Range-Low (ERL) of 8.2 mg/kg (Buchman 2008). Concentrations appeared to increase with greater distance from the Ore Dock area along the Northeast Transect concomitant with finer sediments (Figure 3-7). Along the West Transect arsenic concentrations increased towards

[1] Four stations along the Northeast Transect (SNE-5, 9, 10 and 15) and three stations along the Northwest Transect (SNW-2, 7 and 9).

the mid-transect stations reaching a maximum concentration at SW-6 then generally decreasing with distance from the Ore Dock area, likely due to substrate changes because of the influence of Phillips Creek. The relationship between fines and arsenic is further supported by the results of the PCA, which suggest that arsenic concentrations were strongly (R = 0.86) correlated to sediment particle size (i.e., silt and clay).

Copper concentrations appeared to increase with distance from the Ore Dock area at all transects (Figure 3-8). This is further supported by the results of the PCA, which suggest that reported copper concentrations were related to sediment particle size (i.e., proportion of fines) with a correlation coefficient of 0.96. Copper concentrations measured during the 2023 MEEMP were below the applicable guidelines for all sampling stations, except for a single station (SNE-9) along the Northeast Transect which was marginally above the CCME ISQG (18.7 mg/kg) by 1.2 times, likely due to the higher fines content at that station (73% fines).

Nickel concentrations appeared to increase, generally, with distance from the Ore Dock area along all transects except the West Transect (Figure 3-9). This is further supported by the results of the PCA, which suggest that reported nickel concentrations were related to sediment particle size (i.e., proportion of fines) with a correlation coefficient of 0.99. CCME guidelines are not available for nickel but sediment concentrations were less than the lower (30 mg/kg) and upper (50 mg/kg) BC WSQGs. When compared to NOAA benchmarks, concentrations were slightly above the T_{20} benchmark (15 mg/kg) at 12 stations located along the Northern Offshore Transects and on station (SE-15) along the East Transect (Figure 3-9) by up to 1.6 times, in addition to the Threshold Effect Level (TEL) of 15.9 mg/kg at nine stations by up to 1.5 times.

Overall, the 2023 results are consistent with those reported during previous MEEMP radial transect programs (2014–2020), which documented sporadic and marginal exceedances of ISQGs for some metals in Milne Inlet sediments. Exceedance of generic CCME ISQGs for sediment metals in Northern Canada is not uncommon under naturally occurring background conditions, as evident under baseline conditions in Milne Inlet (e.g., baseline concentrations of up to 9.0 mg/kg arsenic, 25 mg/kg nickel, and 10.0 mg/kg copper were documented in Milne Inlet by SEM [2015]). These 2023 guideline comparison indicate that sediment quality remains within applicable guidelines or expected background conditions.

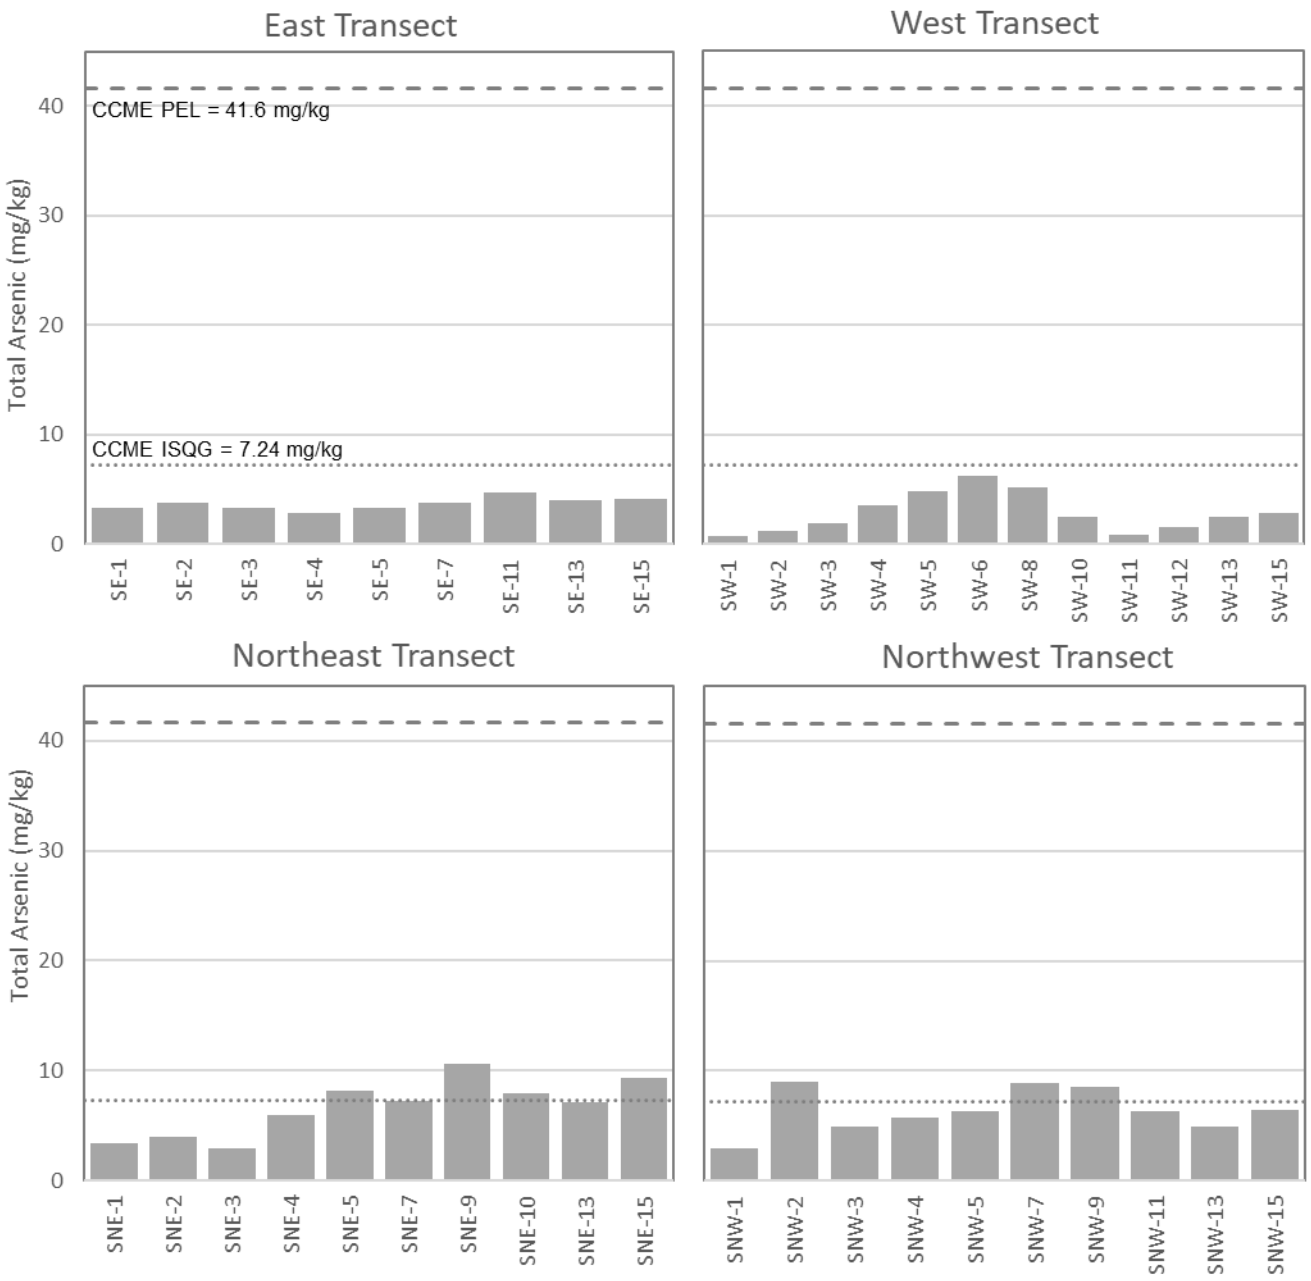

Figure 3-7: Sediment Arsenic Concentrations at Stations Located Along Transects Radiating Out from the Ore Dock Area in Milne Port, 2023.

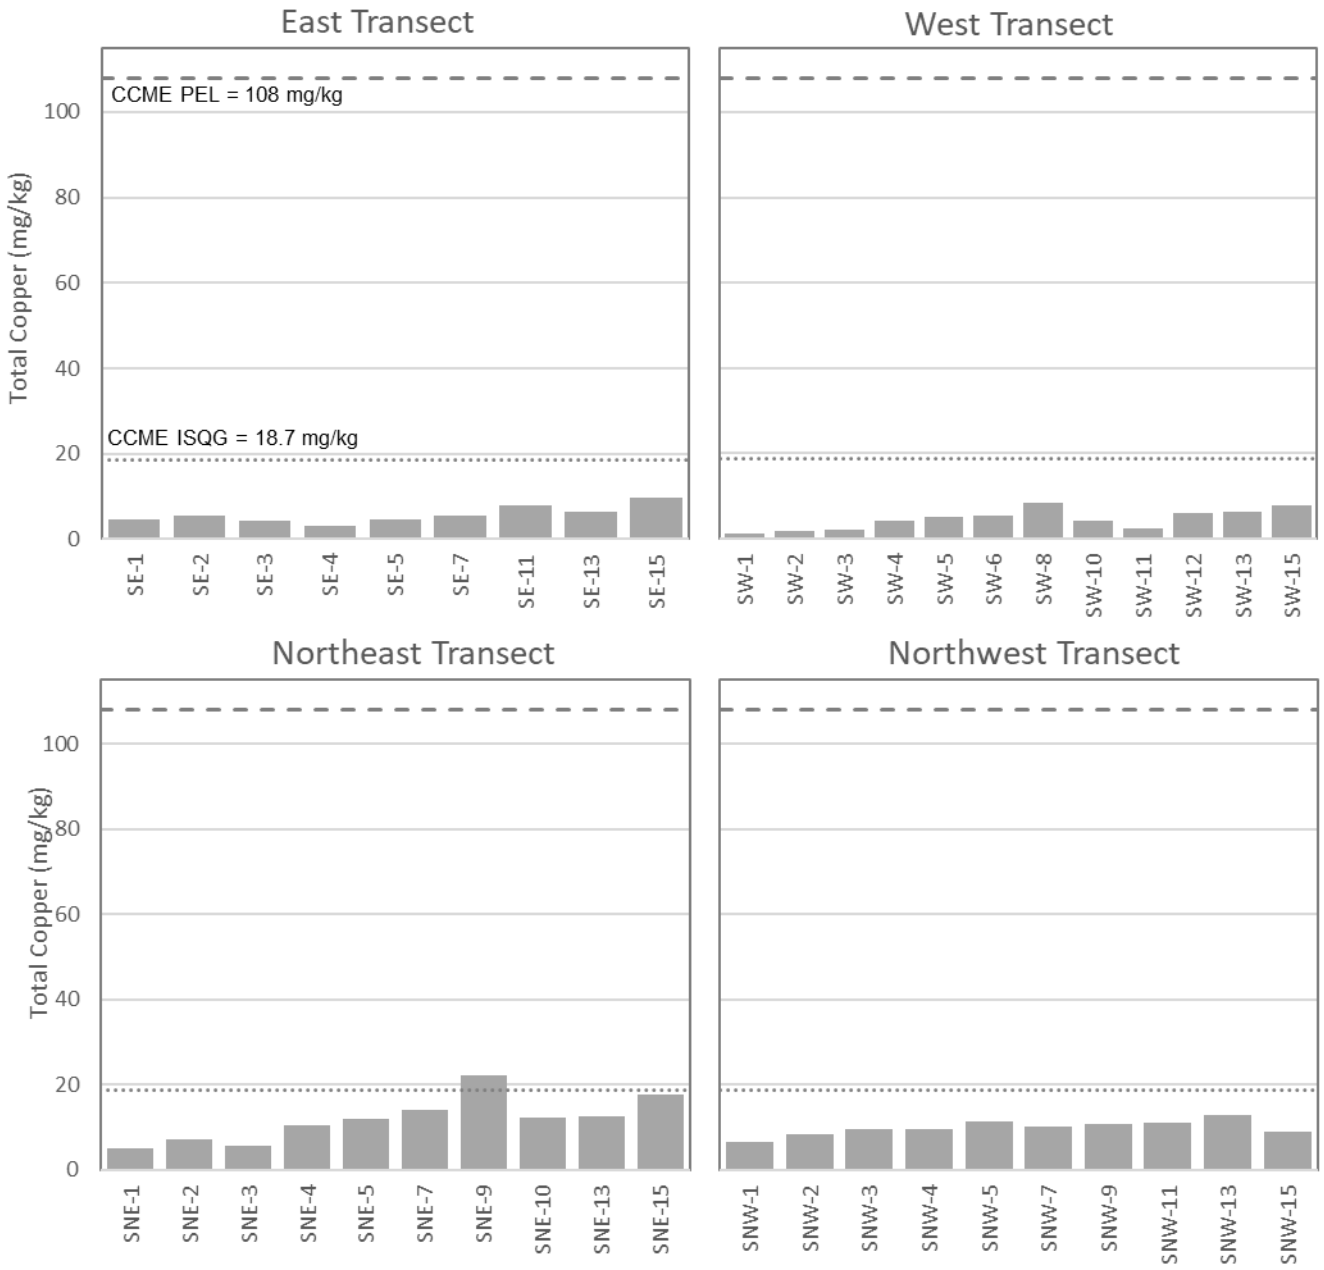

Figure 3-8: Sediment Copper Concentrations at Stations Located Along Transects Radiating Out from the Ore Dock Area in Milne Port, 2023.

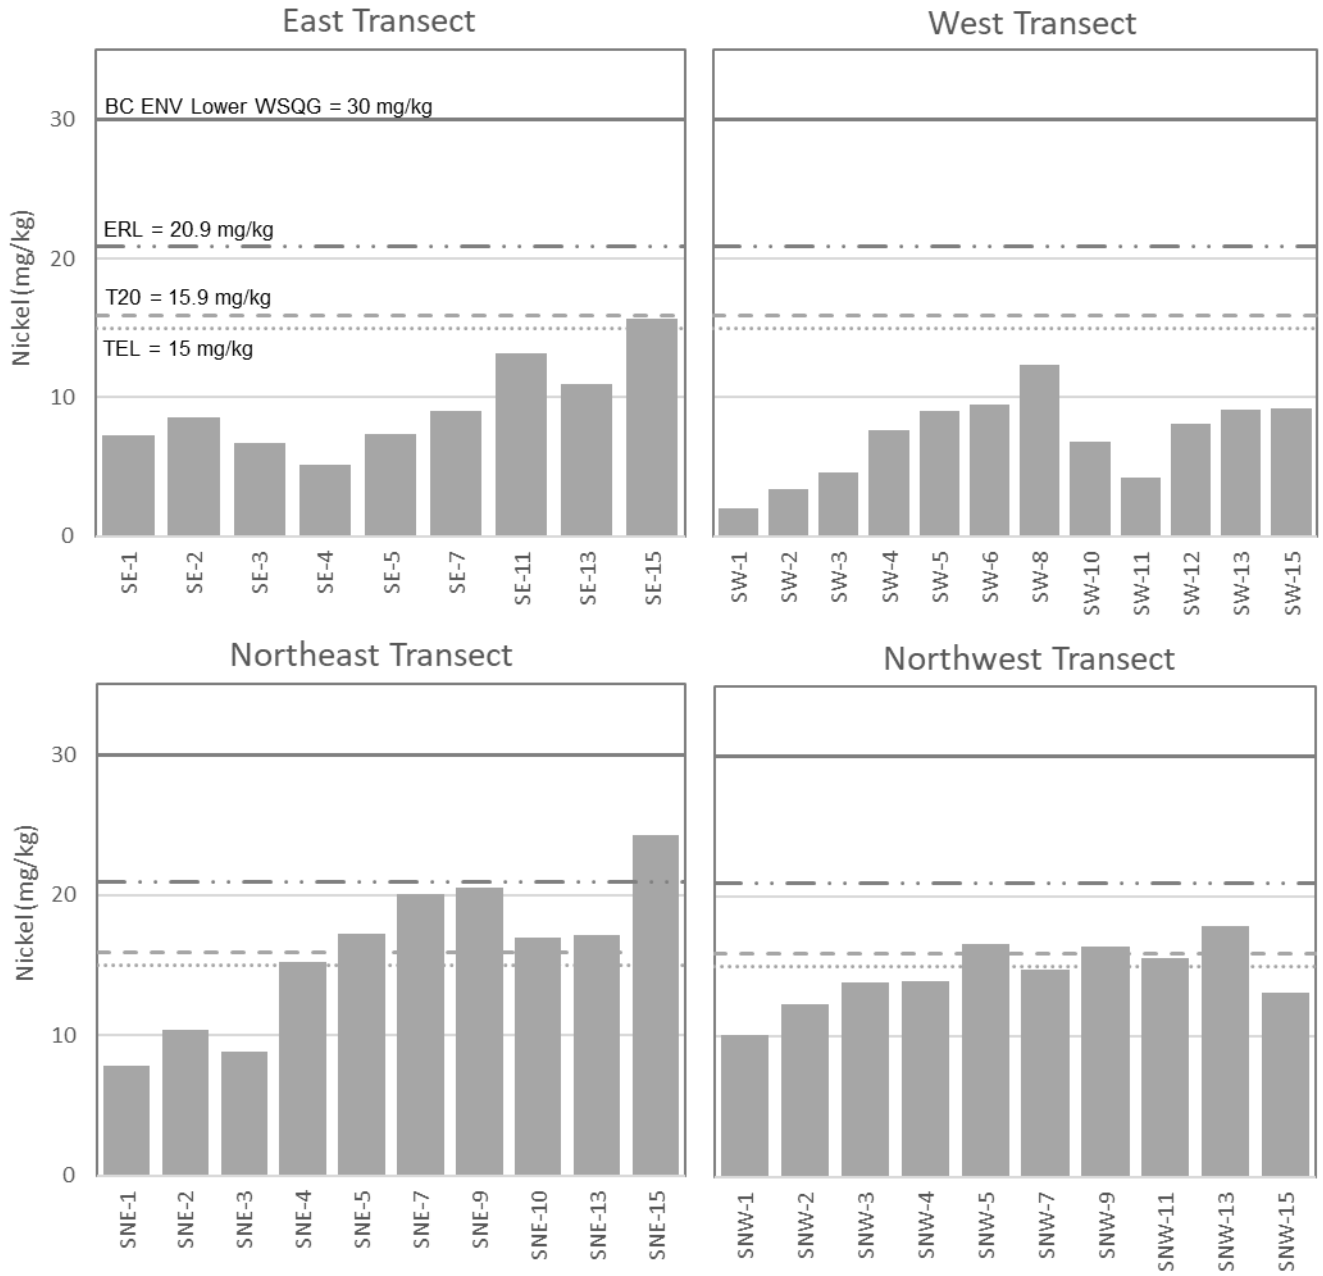

Figure 3-9: Sediment Nickel Concentrations at Stations Located Along Transects Radiating Out from the Ore Dock Area in Milne Port, 2023.

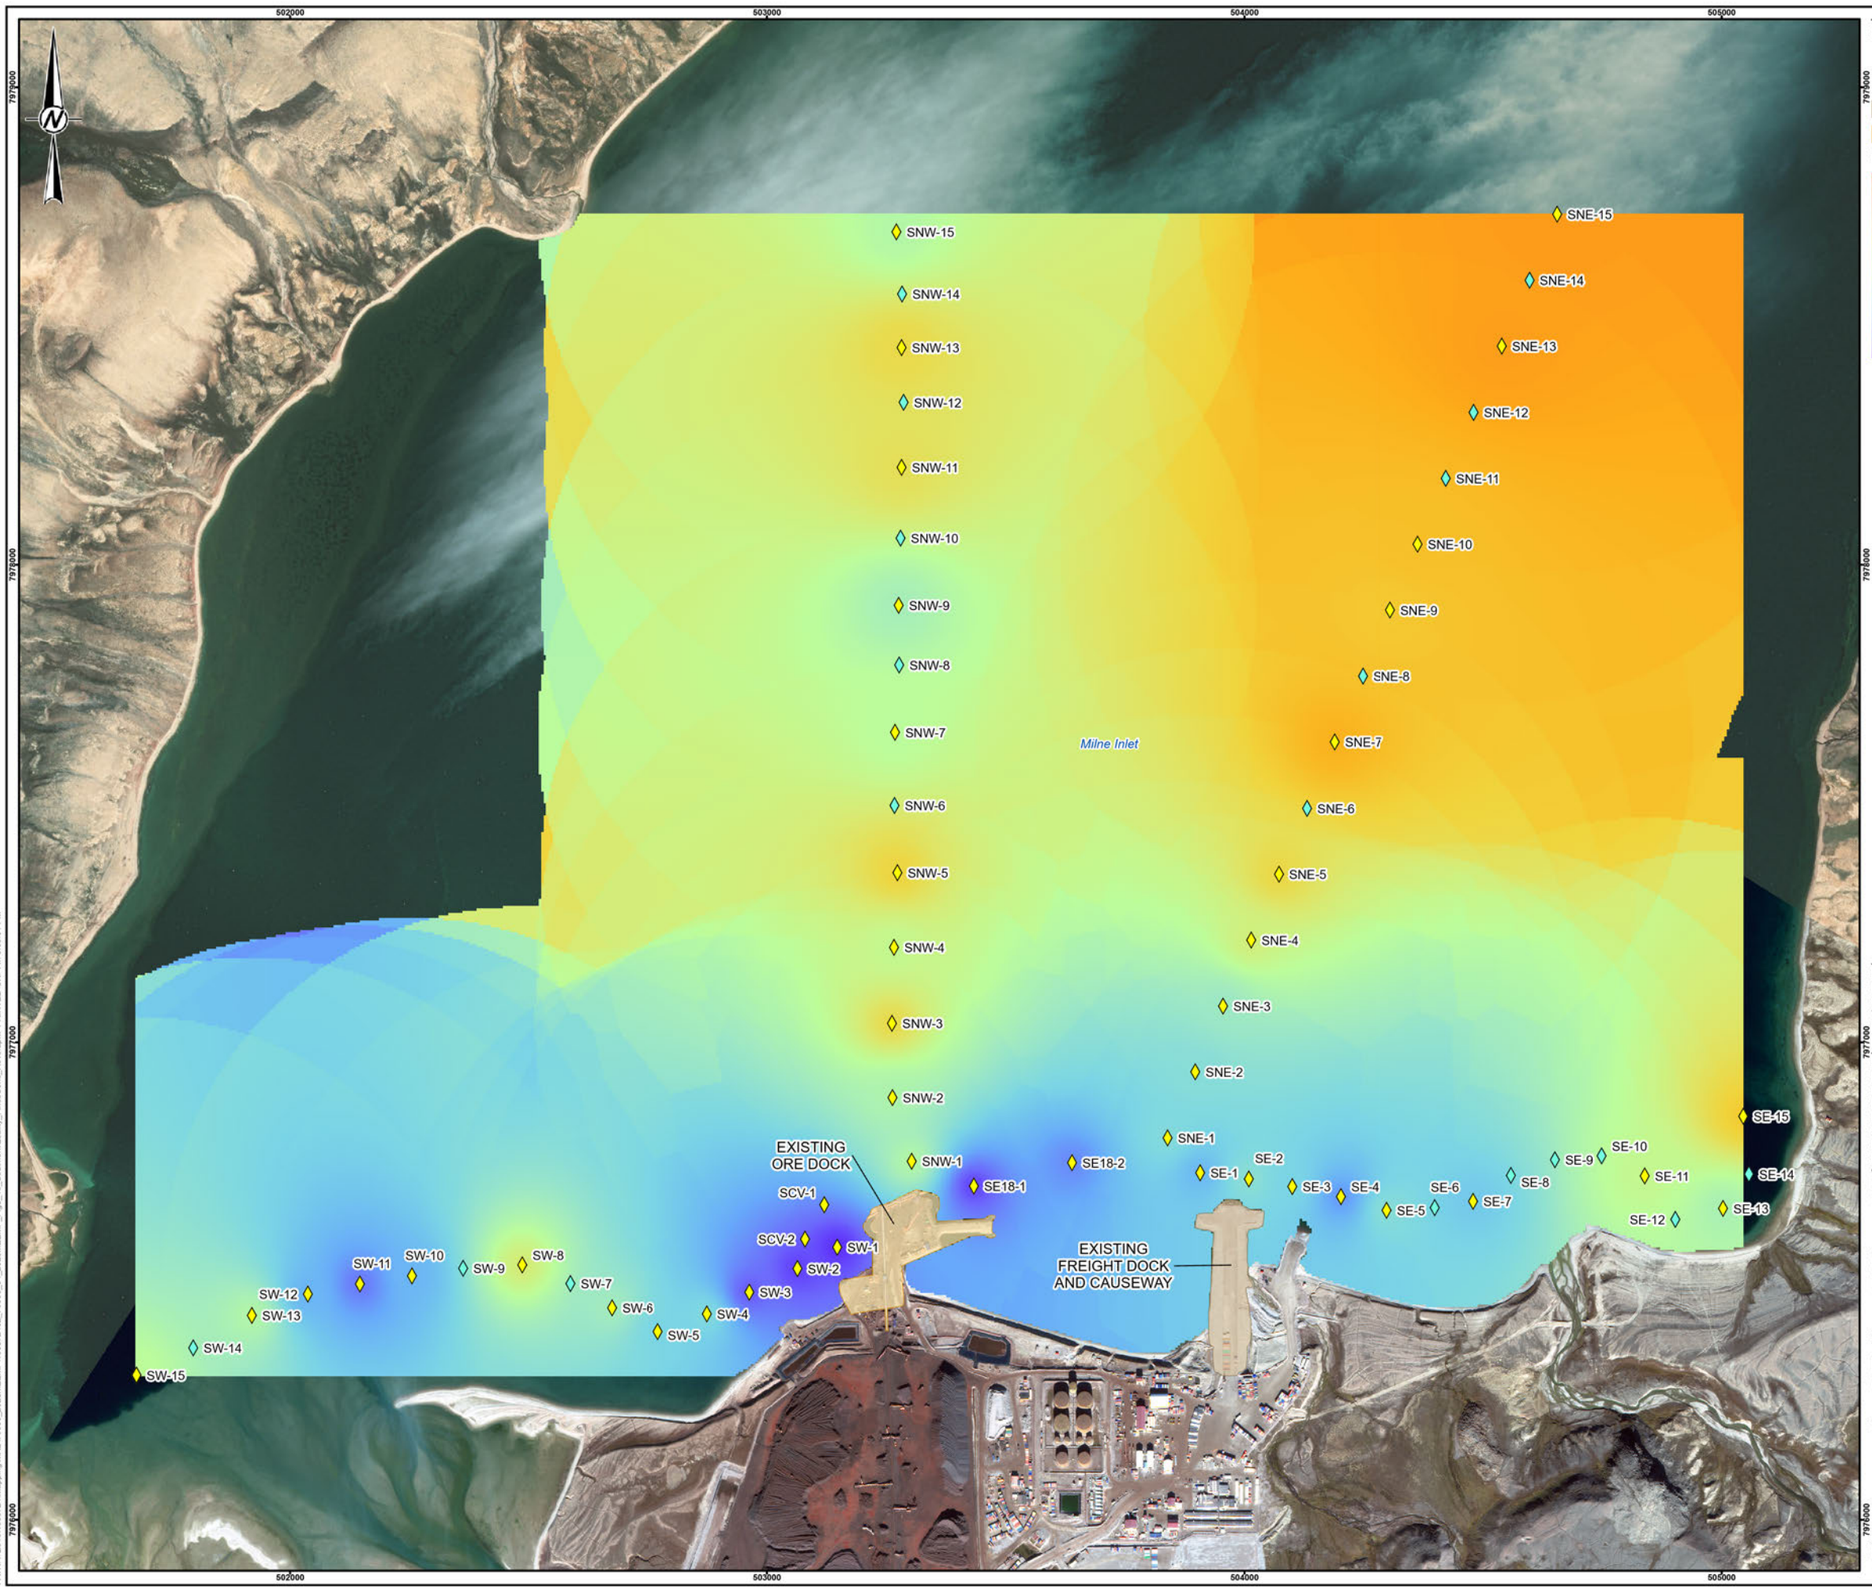
3.4.3.2 Sediment Organic Parameters

Similar to previous MEEMP years, sediment BTEX, petroleum hydrocarbons, and PAHs in 2023 were largely below detection limits in Milne Inlet (Appendix 3D) except for the following sporadic detected low concentrations in the following parameters:



- Ethylbenzene (0.032 mg/kg) and xylene-o (0.06 mg/kg) were detectable at station SNW-13.
- Total PAH (Environmental Protection Agency [EPA] 16-DAS) was detectable with a concentration of 0.141 mg/kg at station SNE-15.

No organic parameter measured in sediments sampled during the 2023 sediment program exceeded sediment quality guidelines except for ethylbenzene. When compared to the NOAA benchmarks, the concentration was above the Apparent Effects Threshold (AET) benchmark (0.004 mg/kg) by 8 times; however, the laboratory detection limit for ethylbenzene is 0.015 mg/kg which is above the NOAA AET benchmark.

3.4.4 Spatio-temporal Distribution of Fines in Sediments

The relationship between the proportion of fine-grained sediments and distance from the Ore Dock area is depicted in Figure 3-3 and Figure 3-10. In Figure 3-10, the proportion of fine-grained sediments tended to increase with distance (yellow to dark orange shade) to north of the Ore Dock area along the Northern Offshore Transects. Although both of these transects showed a pattern of increasing fines with distance from the Ore Dock area, the Northeast Transect had a higher fines content at stations a greater distance from the Ore Dock area relative to the other offshore transect.

This relationship was not observed for the Coastal Transects to the east and west of the Ore Dock area, where the percent fines was more variable and tended to be concentrated in sheltered areas along the coastline, as is expected under natural conditions. Correspondingly, in less sheltered areas consistent with the natural topography of the coastline, coarser sediments were present, as shown on Figure 3-10 (blue shade). As discussed in previous MEEMP reports (Golder 2021), the influence of Phillips Creek on the composition of nearshore sediments downstream of the creek mouth is also evident. The proportion of percent fines at the mouth of Phillips Creek is lower than sediment sampling stations further west and east of the creek; therefore, along the West Transection, particle size composition is influenced by natural transport processes associated with Phillips Creek.

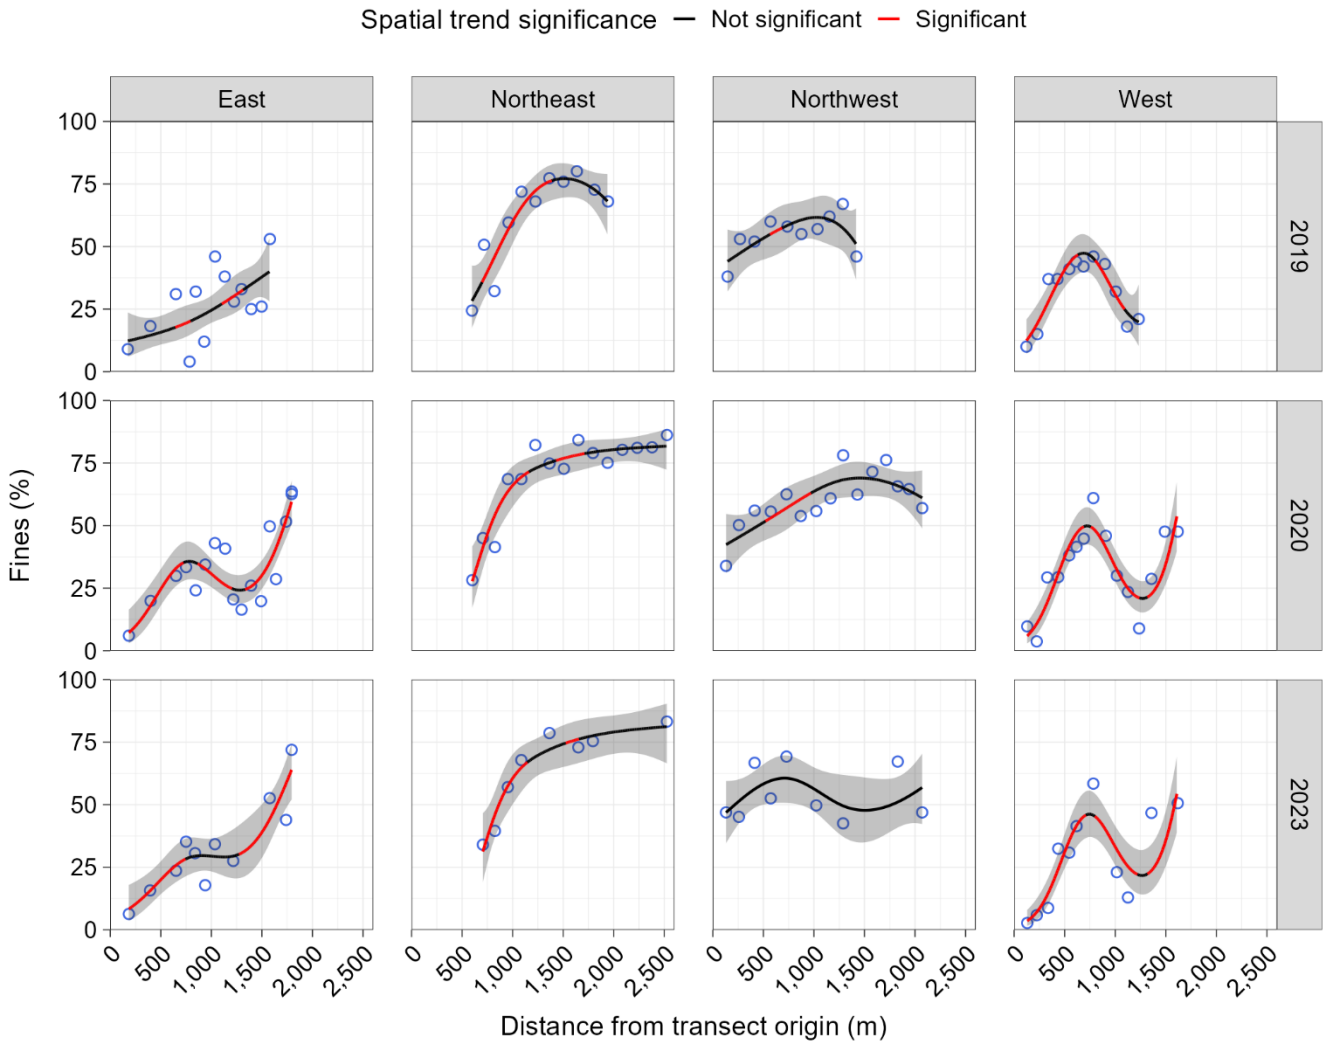
3.4.4.1 Post-2018 Dataset (2019-2023): Spatial and Temporal Comparison

Fines content at sediment stations sampled during the 2019, 2020, and 2023 MEEMP programs, which comprises the Post-2018 Dataset, was evaluated using a beta regression, with main effects of distance from the Ore Dock area, year (as a categorical variable), transect, and all possible interactions between the three variables. The effect of distance was modelled as a natural cubic spline with three degrees of freedom, to account for the non-linearity in spatial trends in fines content. The three-way interaction between distance, year, and transect was not statistically significant (P=0.14; Table 3-3). The only significant two-way interaction was the interaction between distance from transect origin and transect, indicating that spatial trends differed between transects. That is, spatial trends differed between transects but not between sampling years. This finding supported the overall finding from visual examination of the data, where spatial effects were overall similar between years within the same transect (Figure 3-11).

Table 3-3: Effect Significance in Analysis of the Post-2018 Dataset Fines Content

Parameter	Df	X^2	*P*-value
Distance from transect origin	3	155.92	<0.001
Year	2	2.57	0.277
Transect	3	312.24	<0.001
Distance from transect origin × Year	6	9.98	0.125
Distance from transect origin × Transect	**9**	**195.85**	**<0.001**
Year × Transect	6	5.87	0.438
Distance from transect origin × Year × Transect	18	24.65	0.135



Notes: Df = degrees of freedom. Distance and effect of year were modeled as splines. *P*-values of significant interactions (P<0.05) and significant main effects (where no significant interactions were found) are shown in bold.

The results of spatial trends in the assessed transects were as follows:

- **East Transect** – in all three monitoring years there was an increase in fines content with increasing distance from the transect origin, however in 2019, the trend was only significant at two short segments of the transect, whereas in 2020 and 2023, the trends were significant up to ~750 m, followed by another significant increase at distances ~1,400 m to 1,700 m; Figure 3-11). Within 1,000 m from the transect origin, the spatial increase in fines was up to 13% per 100 m in 2019, 69% per 100 m in 2020, and 43% per 100 m in 2023.
- **Northeast Transect** – in all three monitoring years, there was a significant increasing trend in fines content from a distance of ~550 m to a distance of ~1,100 m, followed by a stabilization and a relatively flat trend in fines content (Figure 3-11). That is, along the Northeast Transect, fines increased up to a distance of ~1,100 m, then remained relatively stable within the measured range until the end of the sampled transect. Within 1,000 m from the transect origin, the spatial increase in fines was up to 42% per 100 m in 2019, 137% per 100 m in 2020, and 183% per 100 m in 2023.
- **Northwest Transect** – fines content in proximity to the transect origin had a relatively variable increasing trend, up to a distance of ~1,000 m in 2019 and up to 1,500 m in 2020, and up to a distance of ~750 m in 2023 (Figure 3-11). Likely due to the variability, the trend was only significant at a short segment along the transect in 2019, and between ~500 m and 1,000 m in 2020, with no other significant trends along the

transect. Within 1,000 m from the transect origin, the spatial increase in fines was the lowest compared to other transects, only up to 12% per 100 m, 11% per 100 m, and 16% per 100 m in 2019, 2020, and 2023, respectively.

- **West Transect** – In all sampling years, a significant increase in fines content was estimated up to a distance of ~750 m, followed by a significant decrease in fines (up to a distance of ~1,200 m; Figure 3-11). The drop in fines content at 750 m, followed by an increase again at ~1,300 m, coincides with the convergence of the mouth of Phillips Creek with Milne Inlet on the West Transect (as shown on Figure 3-1). Within 1,000 m from the transect origin, the spatial increase in fines was up to 63% per 100 m in 2019, 102% per 100 m in 2020, and 117% per 100 m in 2023.

Notes: Grey ribbons are 95% confidence intervals. Red lines indicate slopes significantly different from zero.

Figure 3-11: Observed (points) and Estimated (lines) Percent Fines in Sediment Relative to Sampling Distance Along Transects, 2019, 2020, and 2023.

The overall model did not find temporal effects in either interaction or main effects (Table 3-3), despite 2023 values in proximity to the transect origins being up to 33% higher in 2023 compared to 2020 for the Northwest Transect and up to 24% to 50% lower in 2023 compared to 2020, depending on the transect. The significance of multiple comparisons between years was not tested due to the lack of significant year effects in the overall model.

Statistical power was sufficient to detect a reduction of 70% in fines content along each transect between 1,000 m from transect origin and the first sampling station (Appendix 3G). Most observed differences were larger, ranging from -94% (East Transect) to -90% (Northeast Transect), with the exception of the Northwest Transect, where the observed difference was -21%. For three of the four transects, statistical power to detect the observed scouring effects was high (>0.9). For the temporal effects, statistical power was sufficient to detect a decrease in fines content between 2020 and 2023 ranging between 55% and 85%, and an increase in fines content between 2020 and 2023 ranging between 100% and 150% (Appendix 3G). Observed effect sizes ranged from -36% to +27%, and statistical power to detect those was low.

3.4.4.2 Entire Dataset (2014-2023): Spatial and Temporal Comparison

Fines content at sediment stations sampled during the 2014-2020 and 2023 MEEMP programs, which comprises the Entire Dataset, was evaluated using a beta regression with main effects of distance from the Ore Dock area, year (as a continuous variable), transect, and all possible interactions between the three variables. The effects of distance and year were modelled as natural cubic splines with three and four degrees of freedom, respectively, to account for the non-linearity in spatial and temporal trends in fines content. The three-way interaction between distance, year, and transect was statistically significant (P<0.001; Table 3-4), indicating that the interannual difference in spatial trends differed between transects (i.e., the interaction between distance from transect origin and year differed between transects). This finding supported the visual differences seen in spatial trends between the different survey years and transects (Figure 3-12). Comparison of trends between years was not possible for the Northeast Transect because 2019 was the first year that this transect was sampled; thus, results for the Northeast Transect are included in the Post 2018 Dataset analysis only. The ‘North’ Transect referred to in this section refers to the ‘Northwest Transect in the 2019, 2020 and 2023 MEEMP years.

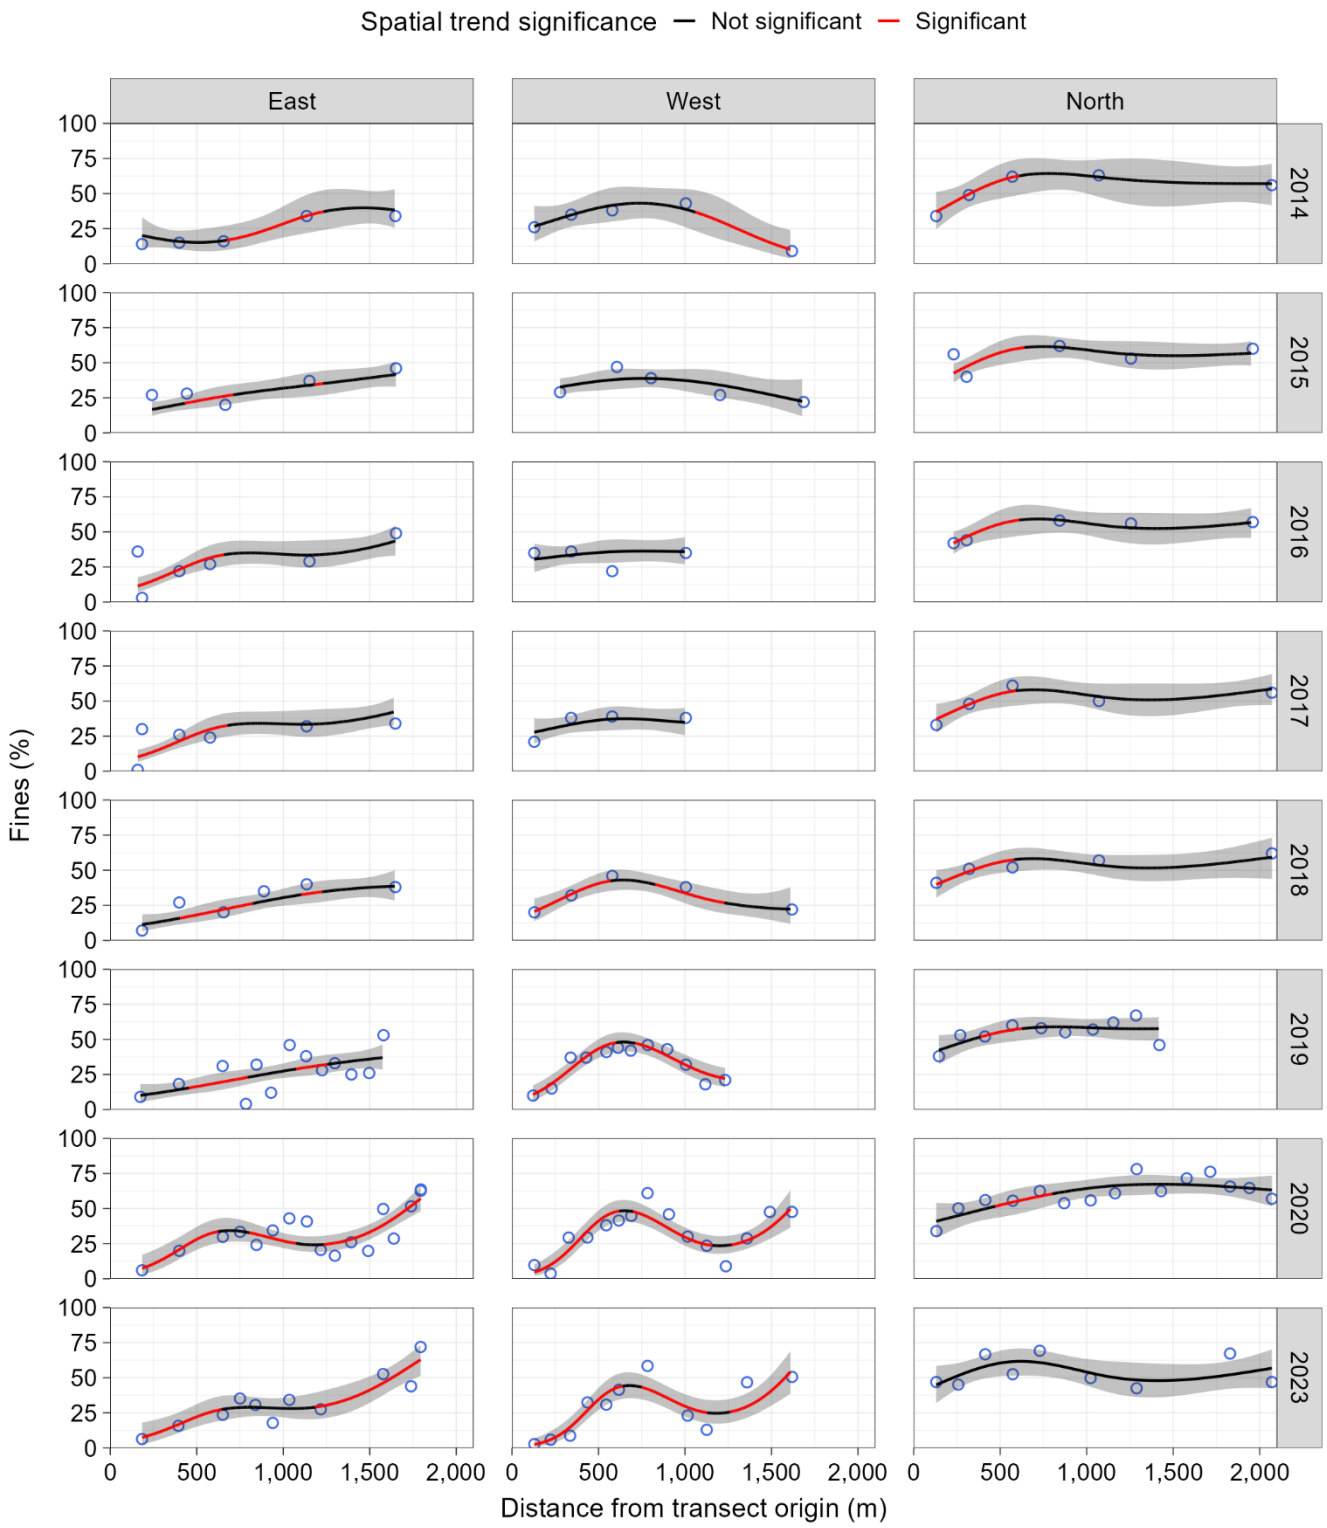


Table 3-4: Effect Significance in Analysis of the Entire Dataset Fines Content

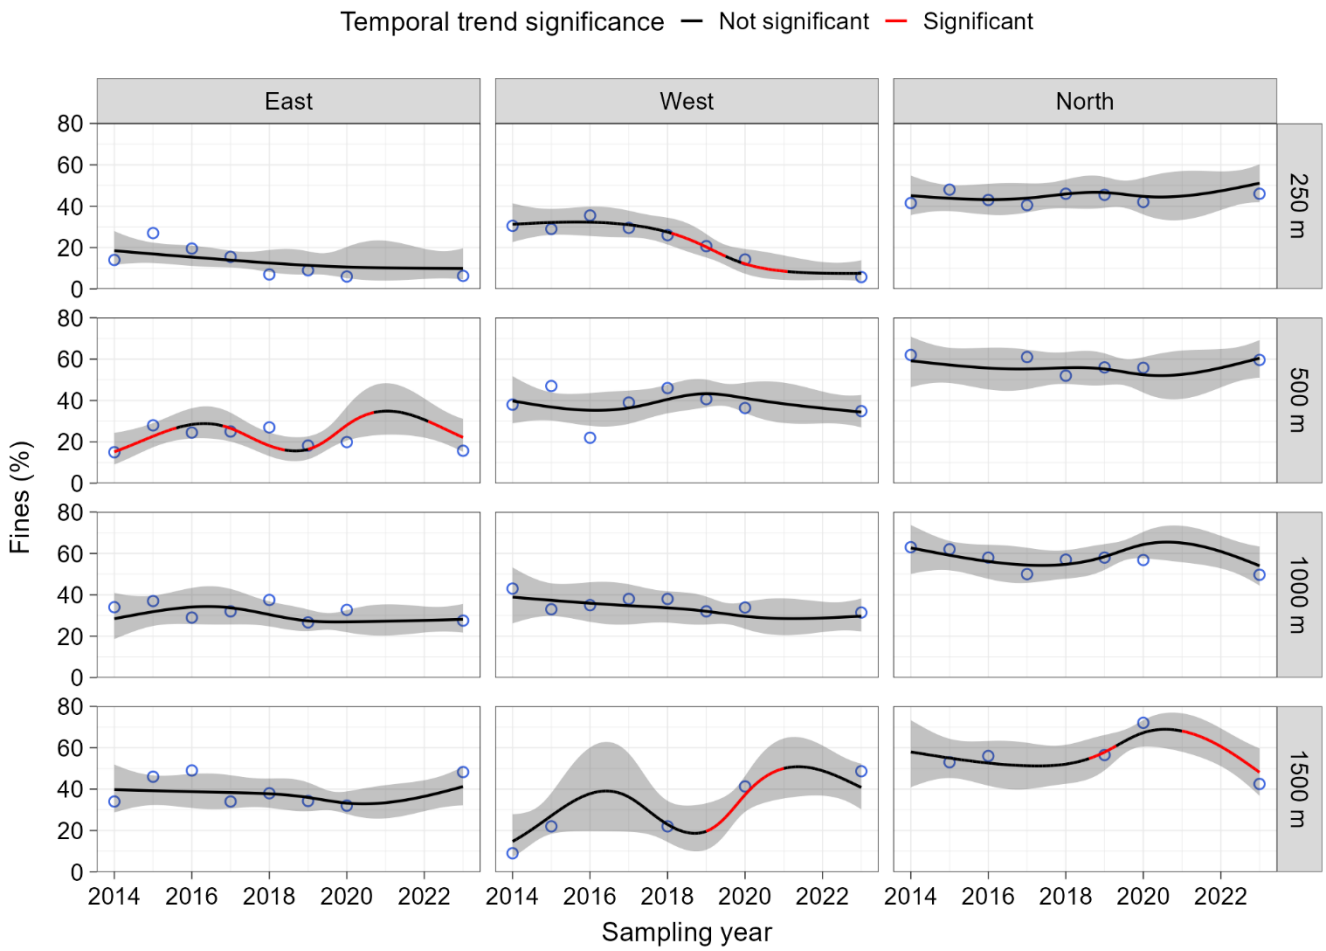
Parameter	Df	X^2	*P*-value
Distance from transect origin	3	129.68	<0.001
Year	4	1.60	0.808
Transect	2	316.15	<0.001
Distance from transect origin × Year	12	16.19	0.182
Distance from transect origin × Transect	6	82.24	<0.001
Year × Transect	8	7.27	0.508
Distance from transect origin × Year × Transect	24	81.37	**<0.001**

Notes: Df = degrees of freedom. Distance and effect of year were modeled as splines. *P*-values of significant interactions (P<0.05) and significant main effects (where no significant interactions were found) are shown in bold.

The results of spatial trends in the assessed transects were as follows:

- **East Transect** – generally, there was a significant increase in fines content with distance from the transect origin in proximity to the transect origin (distances up to ~750 m) between 2014 and 2023; Figure 3-12). Within 1,000 m from the transect origin, the maximum annual value of spatial increase in fines ranged between 18% per 100 m (2015) and 87% per 100 m (2020).
- **West Transect** – in the earlier sampling years (2014-2017), fines content in proximity to the transect origin did not have a significant spatial trend. However, between 2018 and 2023, a significant increase in fines content was estimated up to a distance of ~750 m, followed by a significant decrease in fines (up to a distance of ~1,200 m; Figure 3-12) due to the influence of Phillips Creek. Within 1,000 m from the transect origin, the maximum annual value of spatial increase in fines ranged between 7% per 100 m (2016) and 169% per 100 m (2023).
- **North (Northwest) Transect** – between 2014 and 2018, fines content in proximity to the transect origin had a significant spatial trend, up to a distance of ~600 m (Figure 3-12). However, the significance of the trend had a smaller spatial extent in 2019 and 2020 and was absent altogether in 2023. That is, in 2023, there was no significant increase or decrease in fines content along the North Transect. Within 1,000 m from the transect origin, the spatial increase in fines was the lowest compared to other transects, ranging between only between 14% per 100 m (2020) and 33% per 100 m (2014).

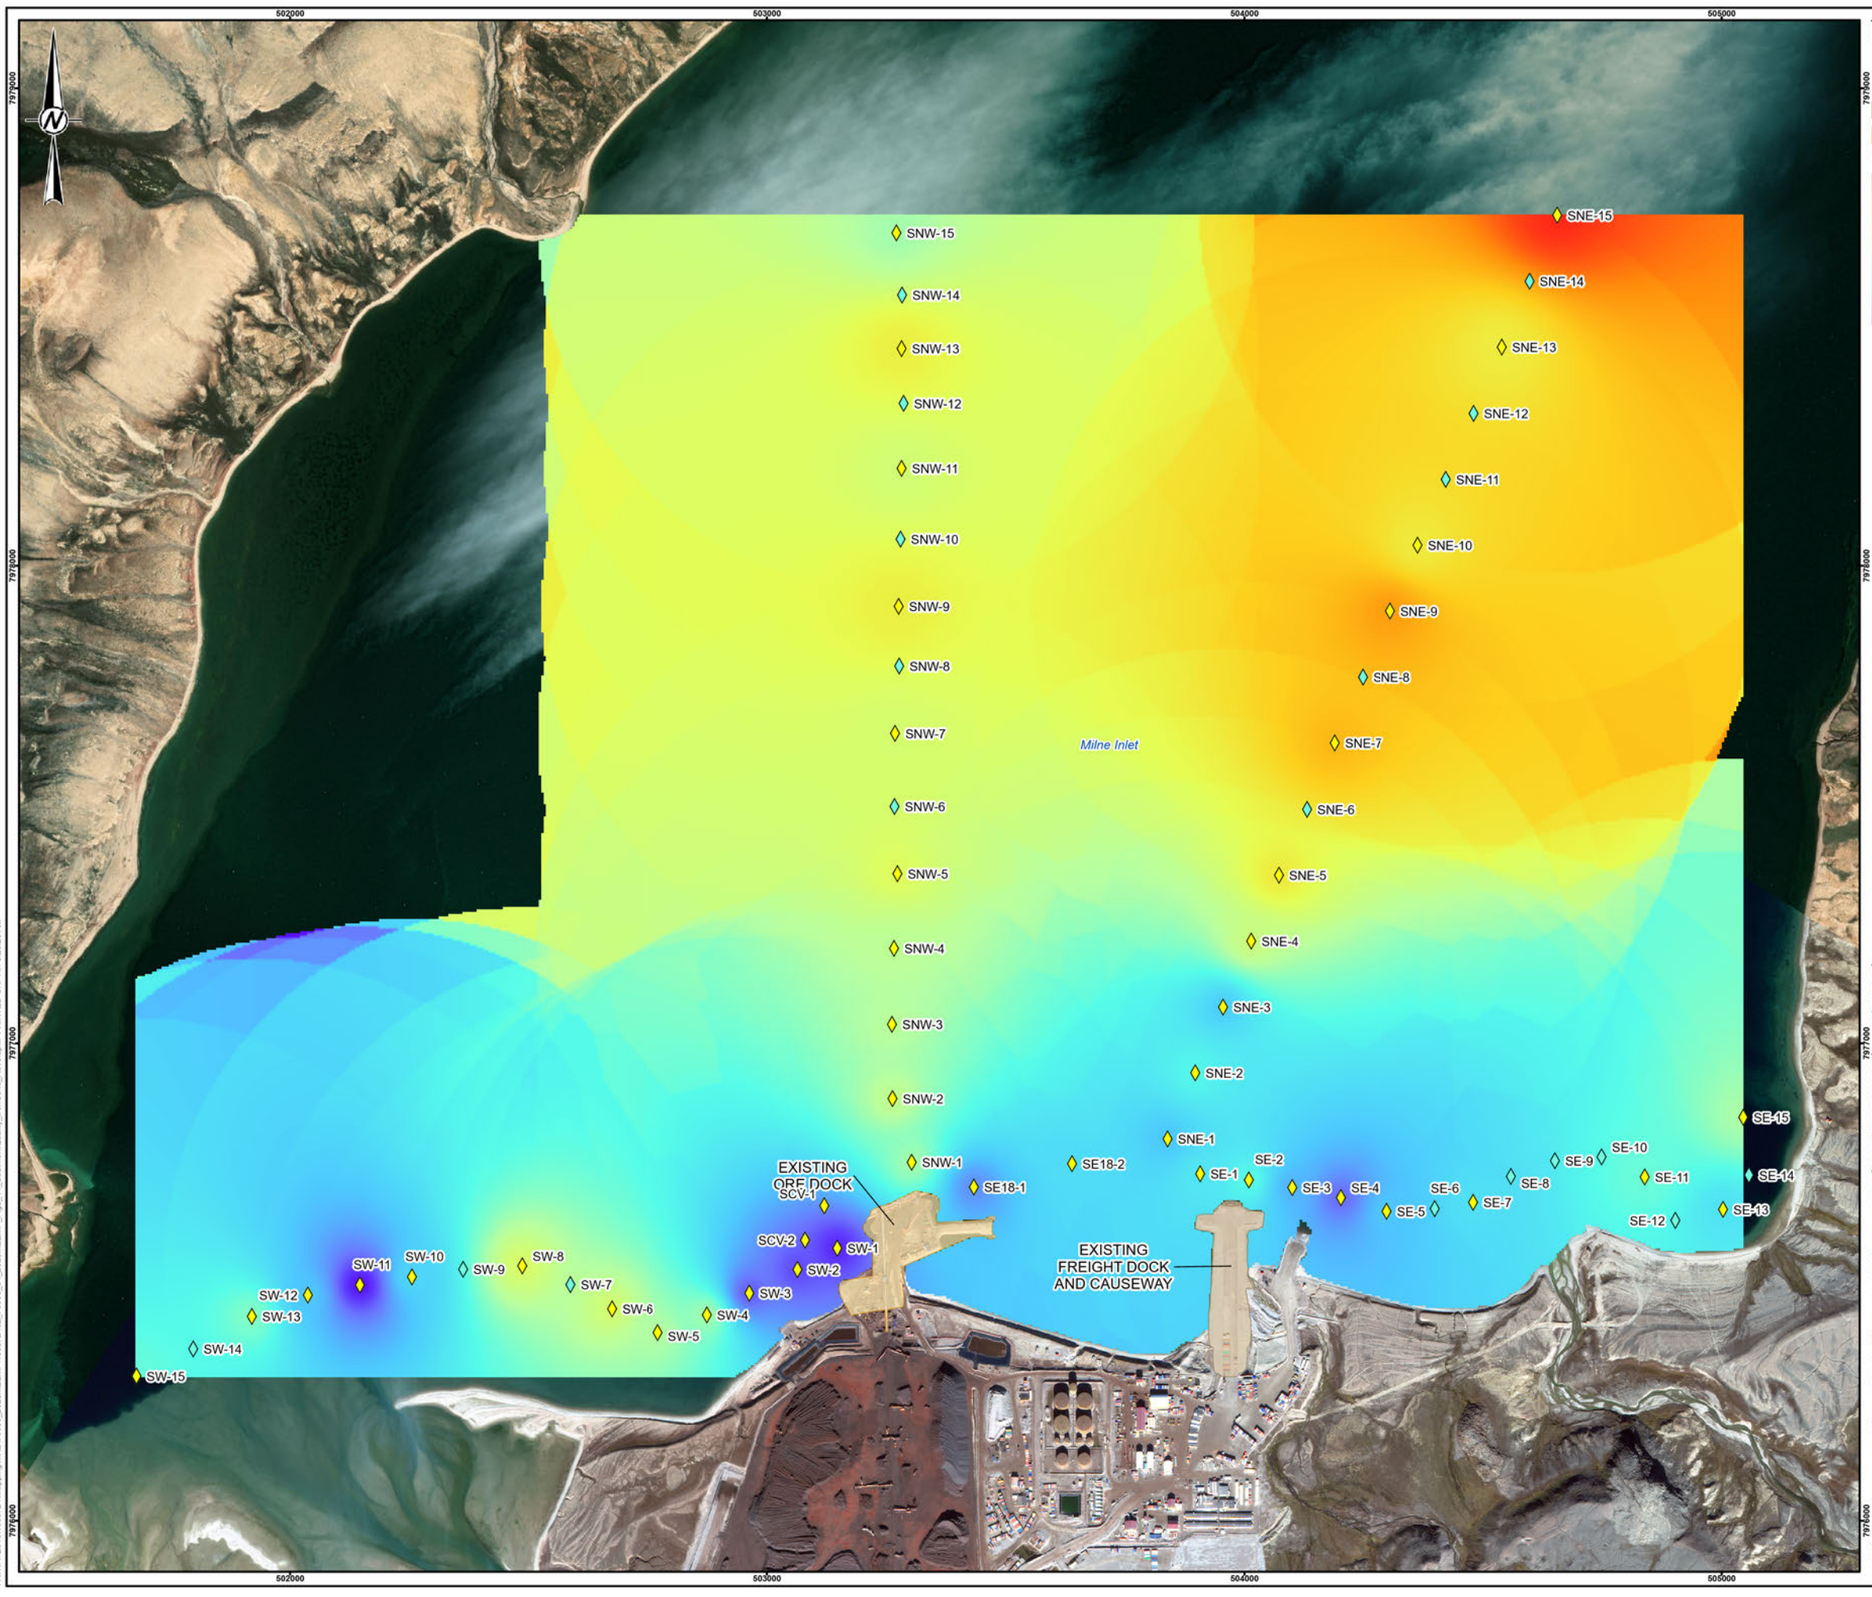


Notes: Grey ribbons are 95% confidence intervals. Red lines indicate slopes significantly different from zero.

Figure 3-12: Observed (points) and Estimated (lines) Percent Fines in Sediment Relative to Sampling Distance Along Transects, 2014 to 2020 and 2023.

The results of temporal trends in the assessed transects at distances of 250 m, 500 m, 1,000 m, and 1,500 m from transect origin were as follows:

- **East Transect** – a significant temporal trend was only found at 500 m, with alternating significant increasing and decreasing trends. While trends were significant, the values of fines content sampled in 2020 and 2023 were similar to the value in 2014 (Figure 3-13). No other temporal trends were found at the remaining assessed distances. At proximity to transect origin between 2020 and 2023, the change in fines contents ranged from -37% per year (500 m) to -1% per year (250 m).
- **West Transect** – a significant decreasing trend in fines content was estimated at 250 m from the transect origin between 2018 and 2020, likely due to the propeller wash scouring in the immediate vicinity of the Ore Dock area (Figure 3-13). In addition, at 1,500 m, a significant increasing trend was estimated between 2018 and 2020 likely due to the continual influence of Phillips Creek. No other temporal trends were found at the remaining assessed distances. At proximity to transect origin between 2020 and 2023, change in fines contents ranged from -8% per year (500 m) to -1% per year (250 m).
- **North (Northwest) Transect** – a significant increasing trend was estimated in 2019, followed by a significant decreasing trend between 2020 and 2023 (Figure 3-13). The cause for this trend is not clear (Figure 3-13); however, as shown in Figure 3-3, the Northeast Transect continued to show a progressive increase in fines with distance from the Ore Dock area but this transect was not included in the temporal trend analysis because it was added in 2019. Future reporting could include the Northeast Transect in the temporal trend analysis if there is a sufficient number of years of data. No other temporal trends were found at the remaining assessed distances for the North Transect. At proximity to transect origin between 2020 and 2023, change in fines contents ranged from +16% per year (250 m) to +21% per year (500 m).



Notes: Grey ribbons are 95% confidence intervals. Red lines indicate slopes significantly different from zero.

Figure 3-13: Observed (points) and Estimated (lines) Percent Fines in Sediment Relative to Survey Year at Four Distances Along Each Transect – 250 m, 500 m, 1000 m, and 1500 m from Transect Origin.

Statistical power was sufficient to detect a reduction of 70% in fines content along each transect between 1,000 m from transect origin and the first sampling station on each transect (Appendix 3G). Two of the three transects in 2023 had differences larger than this cut-off (-94 and -93% for the East and West Transects, respectively), whereas the observed difference for the North Transect was smaller (-20%). That is, power was high to detect the observed effects for two of the three transects. For the temporal effects assessment, statistical power was sufficient to detect a 70% to 80% decrease in fines content between 2020 and 2023 for the East and North Transects, respectively, but not for any of the examined negative effect sizes for the West Transect (see Appendix 3G). Observed differences between 2023 and 2020 ranged from -41% to +39%, and statistical power to detect those was low.

3.4.5 Spatio-temporal Iron Concentrations in Sediments

The relationship between the distance from the Ore Dock area and sediment iron concentrations is depicted in Figure 3-14. The sediment iron content tends to increase with distance (yellow to orange to red shade) to north of the Ore Dock area along the Northern Offshore Transects (Figure 3-14). This relationship was not observed for the Coastal Transects to the east and west of the Ore Dock area, where iron concentrations were lower and more variable, a pattern that mirrored that described for the distribution of fines in Section 3.4.4. There was a strong linear relationship between percent fines in sediments and the iron content in the Post-2018 Data (Figure 3-15) and the Entire Dataset (Figure 3-16).

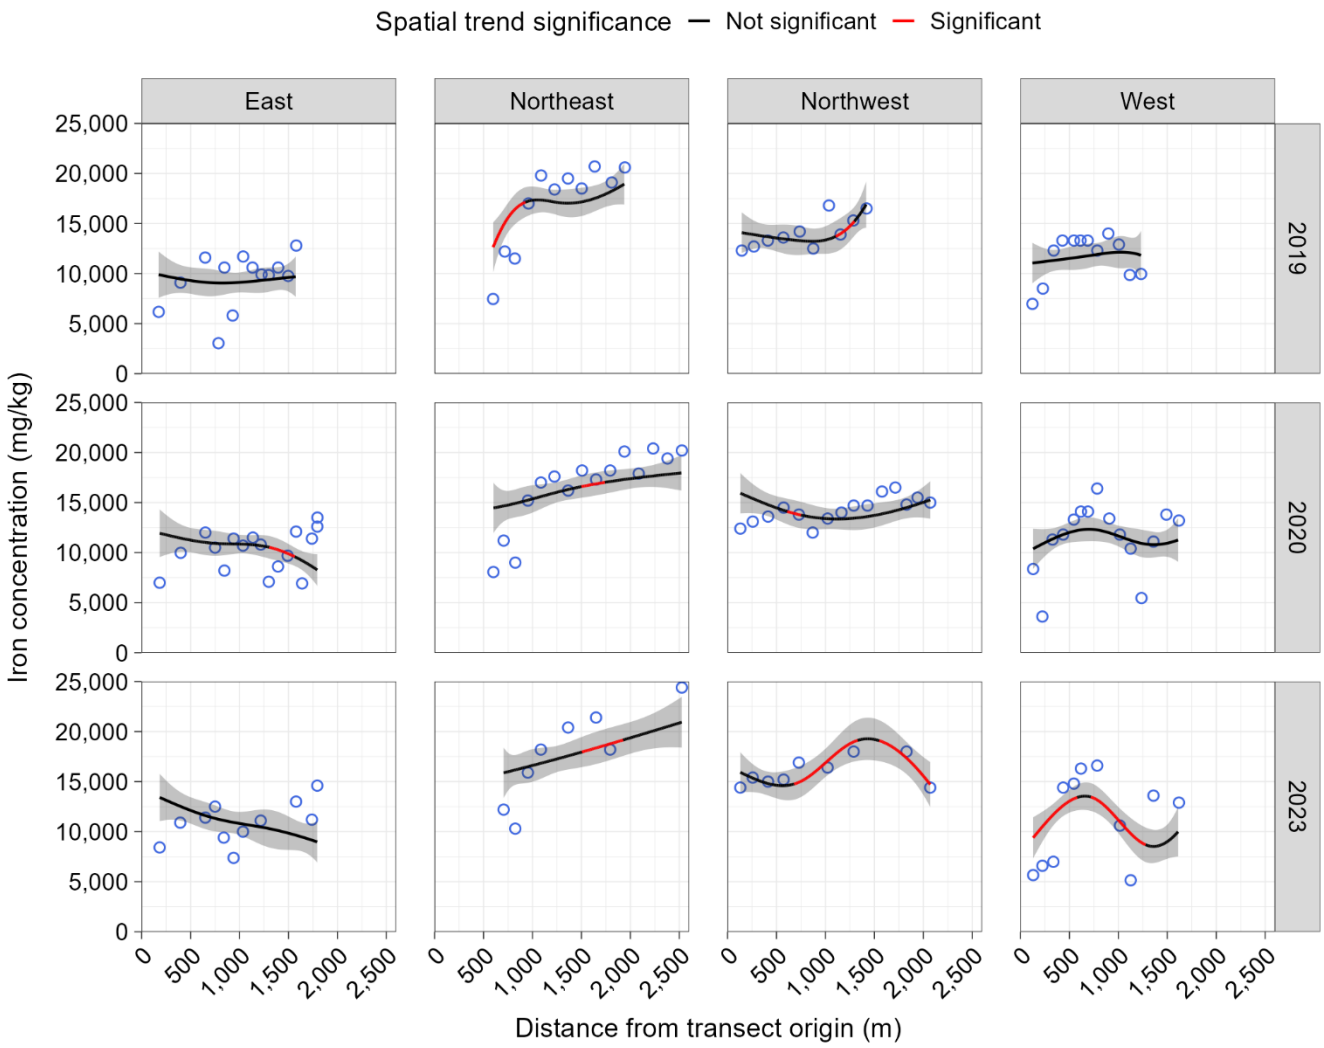
Figure 3-16: Relationship Between Iron Concentration and Fines Content in Sediment, Entire Dataset.

3.4.5.1 Post 2018 Dataset (2019, 2020 and 2023): Spatial and Temporal Comparison

Iron concentration at sediment stations sampled during the 2019, 2020, and 2023 MEEMP programs was evaluated using a linear regression, with main effects of distance from the Ore Dock area, year (as a categorical variable), transect, all possible interactions between the three variables, and a main effect of fines content, to account for the relationship between fines content and iron concentrations. The effect of distance was modeled as a natural cubic spline with three degrees of freedom, to account for the non-linearity in spatial trends in fines content. The three-way interaction between distance, year, and transect was not statistically significant (P=0.071; Table 3-5), indicating that the interannual difference in spatial trends did not differ between transects (i.e., the interaction between distance from transect origin and year did not differ between transects). The two-way interactions between distance and transect, as well as between year and transect were statistically significant (P<0.001 and P=0.005, respectively). These findings supported the visualization of spatial trends, where spatial trends differed between transects, however transect-level trends generally did not differ between years (Figure 3-17) The main effect of fines was significant (P<0.001; Table 3-5), as expected, given the strong relationship between the two variables (Figure 3-16).

Table 3-5: Effect Significance in Analysis of Post 2018 Dataset Iron Concentrations

Parameter	Df	X^2	*P*-value
Distance from transect origin	3	3.28	0.024
Year	2	14.97	<0.001
Transect	3	7.85	<0.001
Fines	1	121.87	<0.001
Distance from transect origin × Year	6	1.24	0.291
Distance from transect origin × Transect	9	6.27	**<0.001**
Year × Transect	6	3.30	**0.005**
Distance from transect origin × Year × Transect	18	1.61	0.071



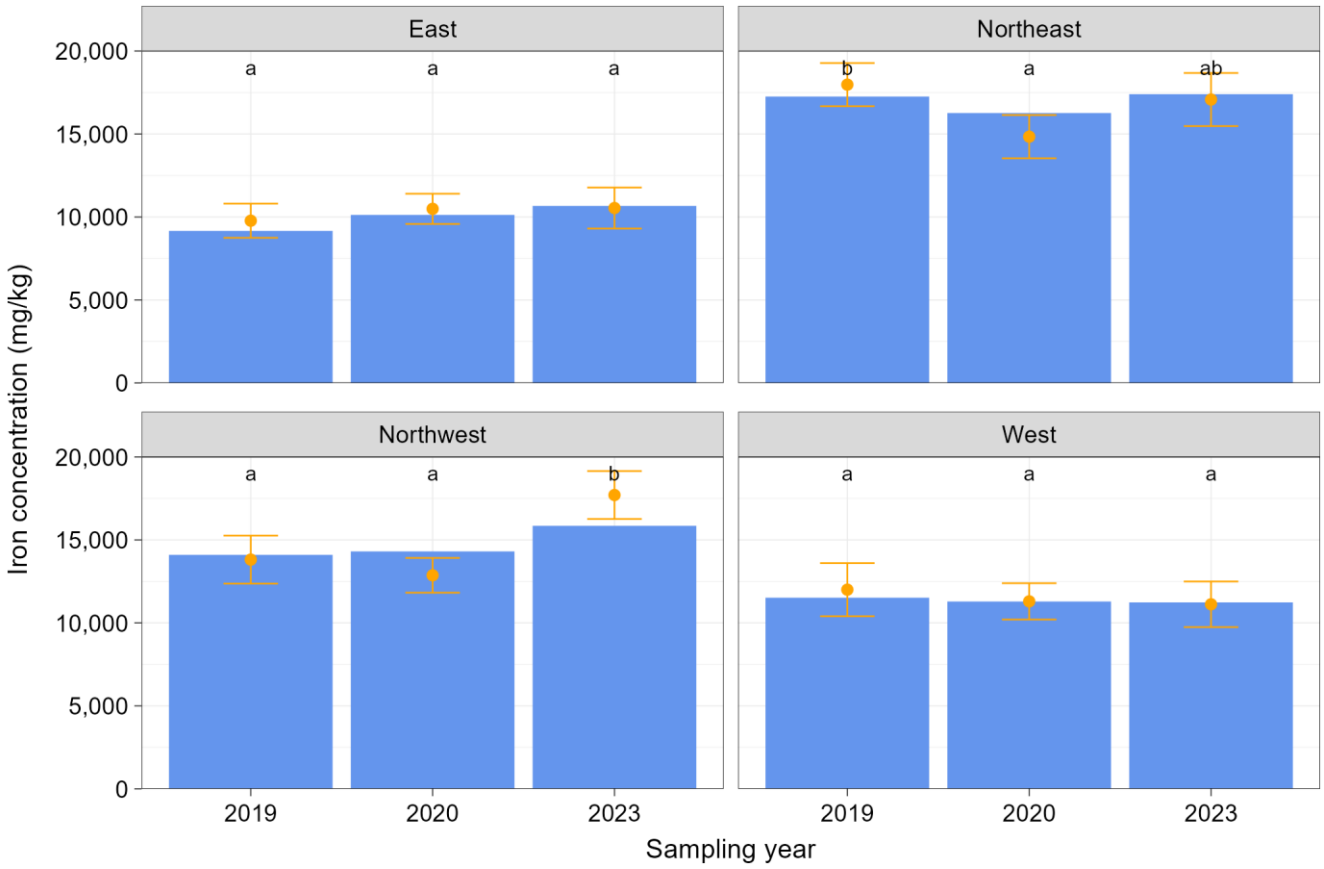
Notes: Df = degrees of freedom. Distance and effect of year were modeled as splines. *P*-values of significant interactions (P<0.05) and significant main effects (where no significant interactions were found) are shown in bold.

The results of spatial trends in the assessed transects were as follows:

- **East Transect** – in 2019, there was no consistent trend in fines-adjusted iron concentrations along the East Transect, while in 2020 and 2023, there was a decreasing trend with distance from transect origin (Figure 3-17). This trend was only significant at ~1,500 m in 2020, likely due to the higher uncertainty around estimates in 2023 (Figure 3-17). Within 1,000 m from the transect origin, the maximum annual value of spatial decrease in fines-adjusted iron concentrations ranged between -437 mg/kg per 100 m (2023) and -205 mg/kg per 100 m (2020).
- **West Transect** – In all sampling years, an increase in fines-adjusted iron content was estimated between transect origin and ~600 m distance, however it was slight and not significant in 2019 and 2020 and more pronounced and statistically significant in 2023 (Figure 3-17). In both 2020 and 2023, this increase was followed by a decrease in fines-adjusted iron concentrations, between ~600 m and ~1,250 m; however, this increase was also slight and not statistically significant in 2020. These results mirror that found for percent

fines and are reflective of the influence of Phillips Creek on the grain size distribution in Milne Inlet at the creek mouth. Within 1,000 m from the transect origin, the maximum annual value of spatial increase in fines-adjusted iron concentrations ranged between 149 mg/kg per 100 m (2019) and 1,188 mg/kg per 100 m (2023).

- **Northeast Transect** – in all three years, there was an increasing trend in fines-adjusted iron concentration with distance from transect origin (Figure 3-17). The significance of the trend differed between years, with a significant increase at distances of ~600 m to ~900 m in 2019, but only at ~1,500 m in 2020 and 2023, likely due to the less pronounced trend in 2020 and the higher uncertainty in estimates in 2023 (Figure 3-17). The lack of sampling between 2,000 m and 2,500 m in 2023 precluded a more refined estimate of trends in fines-adjusted iron at the farthest distances from the origin. Within 1,000 m from the transect origin, the maximum annual value of spatial increase in fines-adjusted iron concentrations ranged between 104 mg/kg per 100 m (2020) and 3,712 mg/kg per 100 m (2019).
- **Northwest Transect** – fines-adjusted iron concentrations decreased slightly between the transect origin and ~600 m in all three years (Figure 3-17). This spatial decrease was followed by an increase in iron content, which was significant in 2019 (at ~1,250 m) and in 2023 (between ~750 m and 1,300 m), but not in 2020. Within 1,000 m from the transect origin, the maximum annual value of spatial decrease in fines-adjusted iron concentrations ranged between -160 mg/kg per 100 m (2019) and -467 mg/kg per 100 m (2023).



Notes: Grey ribbons are 95% confidence intervals. Red lines indicate slopes significantly different from zero. Predicted values used mean fines content for each transect/year combination, and hence may not align with the observed data points which had individual fines content values.

Figure 3-17: Observed (points) and Estimated (lines) Iron Concentrations in Sediment Relative to Sampling Distance Along Transects, 2019, 2020, and 2023.

The overall model found a significant two-way interaction between year and transect, but no other interactions with year temporal effects in either interaction or main effects (Table 3-5). Therefore, multiple comparisons between years were averaged across distances from transect origin, as opposed to at individual distances. Multiple comparisons indicated no significant temporal changes in fines-adjusted iron concentrations at the East and West Transects (Figure 3-18). At the Northeast Transect, fines-adjusted iron concentrations decreased significantly between 2019 and 2020 (P=0.003, effect size of -21%), followed by a 19% increase between 2020 and 2023, which was not significantly different from either 2019 or 2020 (P=0.7 and P=0.09, respectively). At the Northwest Transect, fines-adjusted iron values remained stable between 2019 and 2020 (P=0.5, effect size of -8%), followed by a significant increase between 2020 and 2023 (P<0.001, effect size of +44%).

Statistical power was sufficient to detect a reduction of 35% in fines-adjusted iron concentrations along the Northeast and Northwest Transects, but not for any of the assessed effect sizes for the East and West Transects (Appendix 3G). The low power to detect decreasing iron concentrations at the East and West Transects was due to the low fines content in proximity to the transect origins. Since low fines would be associated with low iron concentrations, the simulated decreases in iron had little effect, resulting in low statistical power. The model had sufficient power to detect increases in iron concentrations in the proximity to transect origins at effect sizes of +120%, +30%, +35%, and +140% for the East, Northeast, Northwest, and West Transects, respectively. The model had sufficient power to detect the observed effect size for the Northeast Transect (-31%), but low power to detect the effect sizes observed at the other transects (-30% to +5%). For the temporal effects, the model had sufficient power (>0.8) to detect a 35%, 35%, 15%, and 25% decreases or increases in fines-adjusted iron concentrations for the East, Northeast, Northwest, and West Transects, respectively (Appendix 3G). Observed effect sizes ranged from +3% to +20%, and statistical power to detect those was low.

Notes: Error bars are 95% confidence intervals. Bars with different letters indicate significant difference between years within the relevant transect panel. Predicted values used mean fines content for each transect, and hence may not align with the observed data points which had individual fines content values.

Figure 3-18: Observed (bars) and Estimated (points and error bars) Iron Concentration in Sediment Relative to Sampling Year and Transect, 2019, 2020, and 2023.

3.4.5.2 Entire Dataset (2014 to 2020 and 2023): Spatial and Temporal Comparison

Iron concentration at sediment stations sampled during the 2014 to 2020 and 2023 MEEMP programs was evaluated using a linear regression, with main effects of distance from the Ore Dock area, year (as a continuous variable), transect, all possible interactions between the three variables, and a main effect of fines content, to account for the relationship between fines content and iron concentrations. The effects of distance and year were modelled as natural cubic splines with three and four degrees of freedom, respectively, to account for the non-linearity in spatial and temporal trends in fines content. The three-way interaction between distance, year, and transect was not significant (Table 3-6), indicating that the interannual difference in spatial trends did not differ between transects (i.e., the interaction between distance from transect origin and year did not differ between transects). The two-way interactions between distance and transect, as well as between year and transect were statistically significant. These findings supported the visualization of spatial trends, where spatial trends differed between transects, however transect-level trends generally did not differ between years (Figure 3-19). The main effect of fines was significant (Table 3-6), as expected, given the strong relationship between the two variables (Figure 3-16).

Comparison of trends between years was not possible for the Northeast Transect because 2019 was the first year that this transect was sampled; thus, results for the Northeast Transect are included in the Post 2018 Dataset analysis only. The ‘North’ Transect referred to in this section refers to the ‘Northwest Transect in the 2019, 2020 and 2023 MEEMP years. In future monitoring years there is expected to be sufficient data to include the Northeast Transect in this analysis.

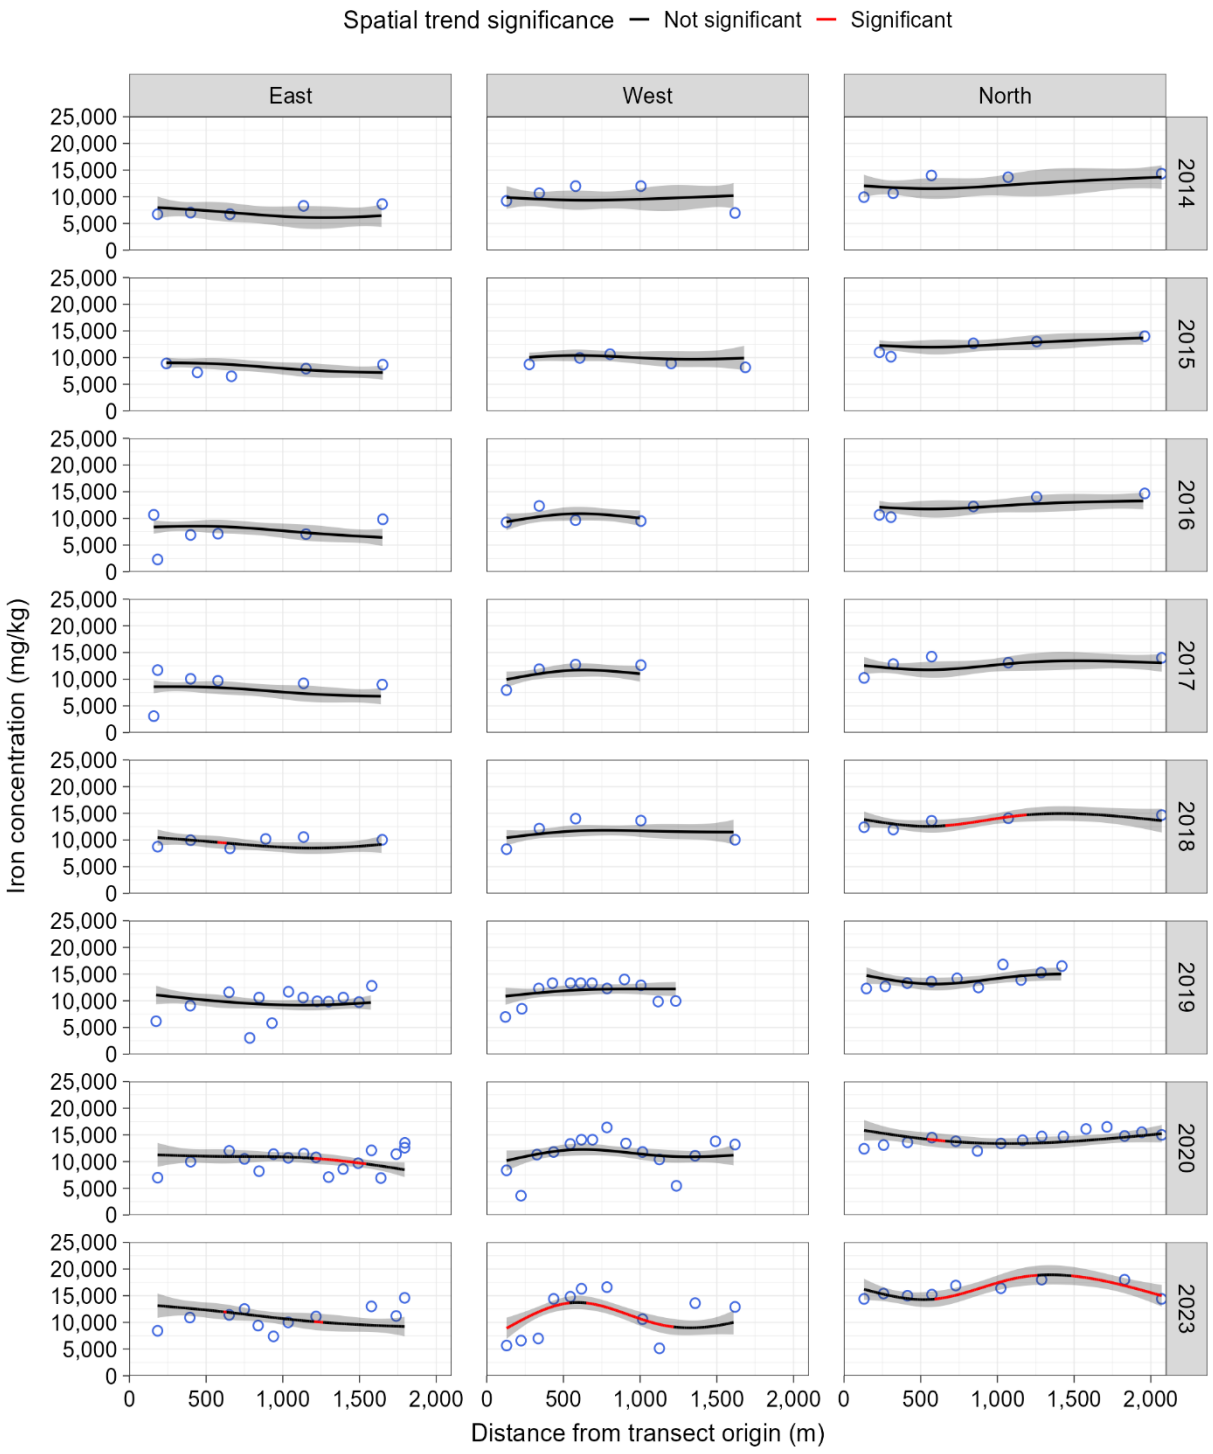


Table 3-6: Effect Significance in Analysis of Entire Dataset Iron Concentrations.

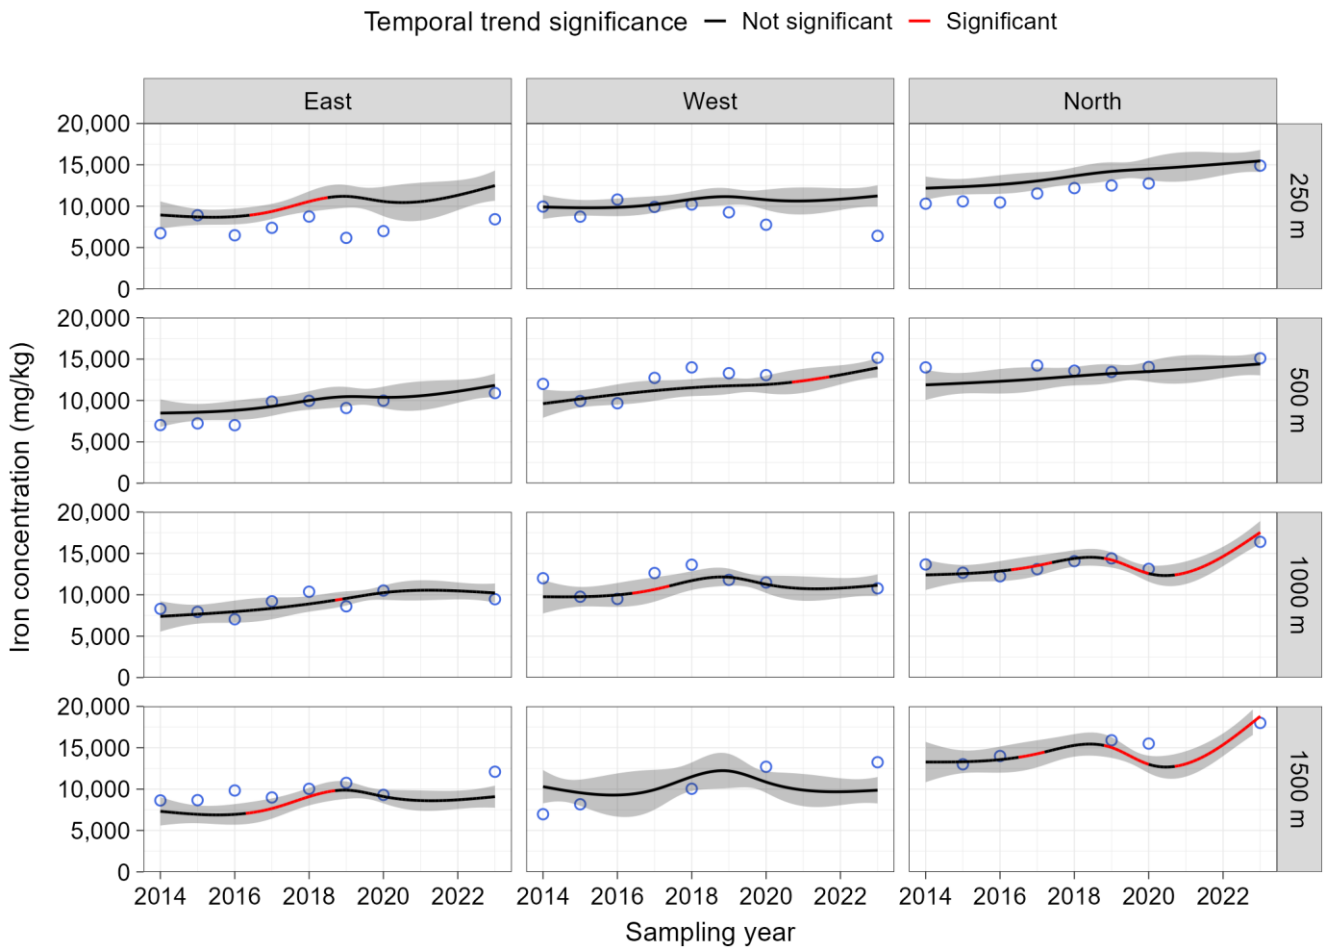
Parameter	Df	F value	*P*-value
Distance from transect origin	3	2.53	0.060
Year	4	23.33	<0.001
Transect	2	18.76	<0.001
Fines	1	168.43	**<0.001**
Distance from transect origin × Year	12	0.84	0.609
Distance from transect origin × Transect	6	7.18	**<0.001**
Year × Transect	8	2.29	**0.025**
Distance from transect origin × Year × Transect	24	1.31	0.167

Notes: Df= degrees of freedom. Distance and effect of year were modeled as splines. *P*-values of significant interactions (*P*<0.05) and significant main effects (where no significant interactions were found) are shown in bold.

The results of spatial of fines-adjusted iron concentration trends in the assessed transects were as follows:

- **East Transect** – generally, there were no consistent significant spatial trends in fines-adjusted iron concentrations along the East Transect (Figure 3-19). Within 1,000 m from the transect origin, the maximum annual value of spatial decrease in fines-adjusted iron concentrations ranged between 337 mg/kg per 100 m (2023) and 101 mg/kg per 100 m (2020).
- **West Transect** – between 2014 and 2020, there were no significant spatial trends in fines-adjusted iron concentrations along the West Transect. In 2023, fines-adjusted iron concentrations increased significantly with distance from the transect origin, up to a distance of ~600 m, followed by a significant decrease in concentrations up to a distance of ~1,200 m (Figure 3-19). Within 1,000 m from the transect origin, the maximum annual value of spatial decrease in fines-adjusted iron concentrations ranged between 1,029 mg/kg per 100 m (2023) and 3 mg/kg per 100 m (2019).
- **North (Northwest) Transect** – between 2014 and 2017, there were no significant spatial trends in fines-adjusted iron concentrations along the North Transect (Figure 3-19). In 2018, and 2023, there was a significant increasing trend in fines-adjusted iron between distances of ~600 m and ~1,200 m. Within 1,000 m from the transect origin, the maximum annual value of spatial decrease in fines-adjusted iron concentrations ranged between 750 mg/kg per 100 m (2023) and 162 mg/kg per 100 m (2015).



Notes: Grey ribbons are 95% confidence intervals. Red lines indicate slopes significantly different from zero. Predicted values used mean fines content for each transect/year combination, and hence may not align with the observed data points which had individual fines content values.

Figure 3-19: Observed (points) and Estimated (lines) Iron Concentrations (mg/kg) in Sediment Relative to Sampling Distance Along Transects, 2014 to 2020 and 2023.

The results of temporal trends in the assessed transects at distances of 250 m, 500 m, 1,000 m, and 1,500 m from transect origin were as follows:

- **East Transect** – there was an overall increasing temporal trend at the assessed distances, although the trend was only found to be significant between 2017 and 2019 (at 250 m), at 2019 (at 1,000 m) and between 2016 and 2019 (at 1,500 m; Figure 3-20). At proximity to transect origin between 2020 and 2023, the change in fines-adjusted iron concentration ranged from 729 mg/kg per year (500 m) to 1,184 mg/kg per year (250 m).
- **West Transect** – estimated temporal trend at 250 m was stable, with little change over time (Figure 3-20). At 500 m from transect origin, an increasing temporal trend was estimated, with a statistically significant slope in 2021 (however note that no data was collected in that year). At both 1,000 m and 1,500 m, the model estimated a slightly increasing trend between 2014 and 2019, followed by a decrease to values similar to 2014-2015 sampling years (Figure 3-20). At proximity to transect origin between 2020 and 2023, the change in fines-adjusted iron concentration ranged from 397 mg/kg per year (250 m) to 859 mg/kg per year (500 m).
- **North (Northwest) Transect** – temporal trends assessed at 250 m and 500 m were slightly increasing and not statistically significant (Figure 3-20). At 1,000 m, significant increases were estimated in 2017 and between 2020 and 2023 (Figure 3-20). At proximity to transect origin between 2020 and 2023, the change in fines-adjusted iron concentration ranged from 328 mg/kg per year (250 m) to 356 mg/kg per year (500 m).

Statistical power was sufficient to detect a reduction of 35% in fines-adjusted iron concentrations for the North Transect between 1,000 m from transect origin and the first sampling station (Appendix 3G). For the remaining two transects, none of the negative effect sizes had sufficient power. The model had sufficient power to detect increases in iron concentrations in the proximity to transect origins at effect sizes of +110%, +110%, and +35% for the East, West, and North Transects, respectively. Observed effect sizes in 2023 ranged between +3% and +37%, and statistical power to detect them was low. For the temporal effects, the model had sufficient power (>0.8) to detect a 65%, 40%, and 25% decrease in fines-adjusted iron concentrations for the East, West, and North Transects, respectively, as well as a 50%, 35%, and 30% increases for the East, West, and North Transects, respectively (Appendix 3G). Observed effect sizes in 2023 ranged between +8% and +16%, and statistical power to detect them was low.

Notes: Grey ribbons are 95% confidence intervals. Red lines indicate slopes significantly different from zero. Predicted values used mean fines content for each transect, and hence may not align with the observed data points which had individual fines content values. North transect is equivalent to the Northwest Transect.

Figure 3-20: Observed (points) and Estimated (lines) Iron Concentrations (mg/kg) in Sediment Relative to Survey Year at Four Distances Along Each Transect – 250 m, 500 m, 1000 m, and 1500 m from Transect Origin.

3.4.6 Capesize Vessel Existing Conditions Sampling Program

In 2023, eight stations (SW-1 through SW-4, SE18-1, SNW-1, SCV-1 and SCV-2) were sampled as part of the Capesize vessel effects monitoring program to monitor for scouring effects on sediment and benthic infauna for three years after the initial use of large (Baby Cape and Capesize) ore carriers (Figure 3-2). As the initial Capesize ore carrier use in Milne Port was planned to take place in the late ice-free period of 2023 (29 August 2023), sampling for Capesize vessel effects monitoring commenced in August 2023 (August 4-19, 2023) with the intention of documenting existing conditions for sediment quality prior to the use of the larger vessels in fall 2023 (Figure 3-2).

3.4.6.1.1 Particle Size Composition

The physical composition of sediments differed among stations in 2023. Sediments from the Capesize vessel stations are comprised primarily of sand (86% to 94%; 0.063 mm – 2.0 mm) at stations SE18-1, SCV-2, SW-1, SW-2, and SW-3 (Figure 3-21) while stations SCV-1, SNW-1, and SW-4 are dominated by sand with silt (i.e., silt fractions range from 27% at SW-4 to 38% at SCV-1; 0.004 mm – 0.063 mm). All eight stations are located within the nearshore area (<30 m bathymetry line) and the observed variability could be due to a combination of the existing influence of scouring due to propeller wash from the smaller carriers and natural coastal processes and variations in morphology.

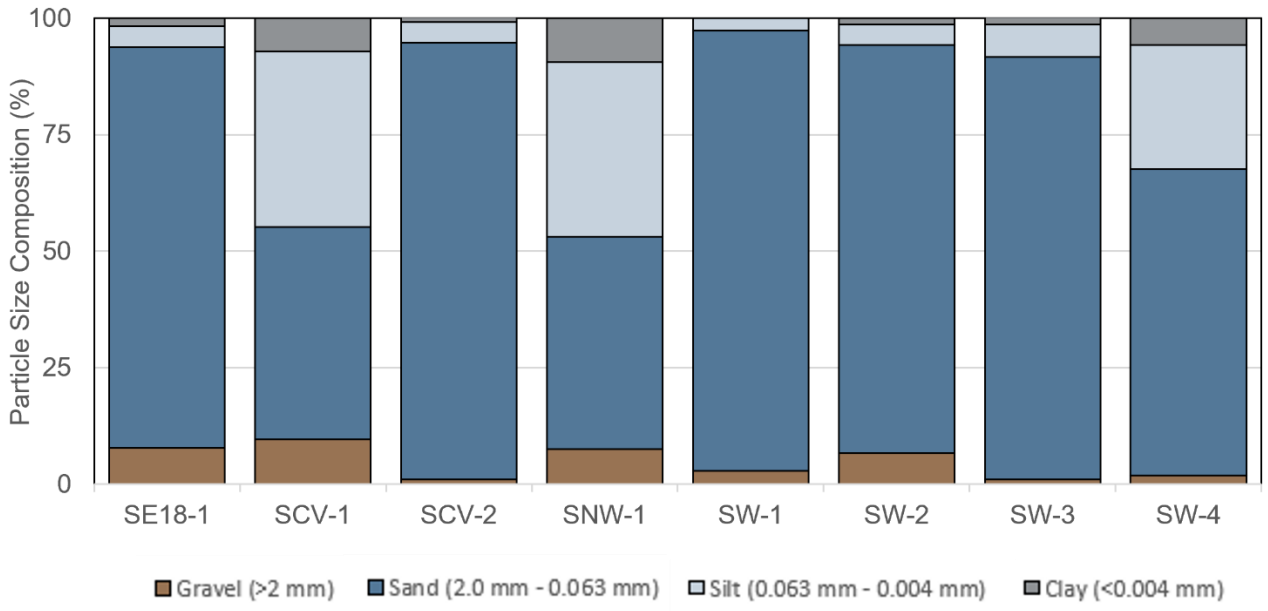


Figure 3-21: Sediment Particle Size Distribution for Capesize Vessel Stations Located in the Vicinity of the Ore Dock Area in Milne Port, 2023.

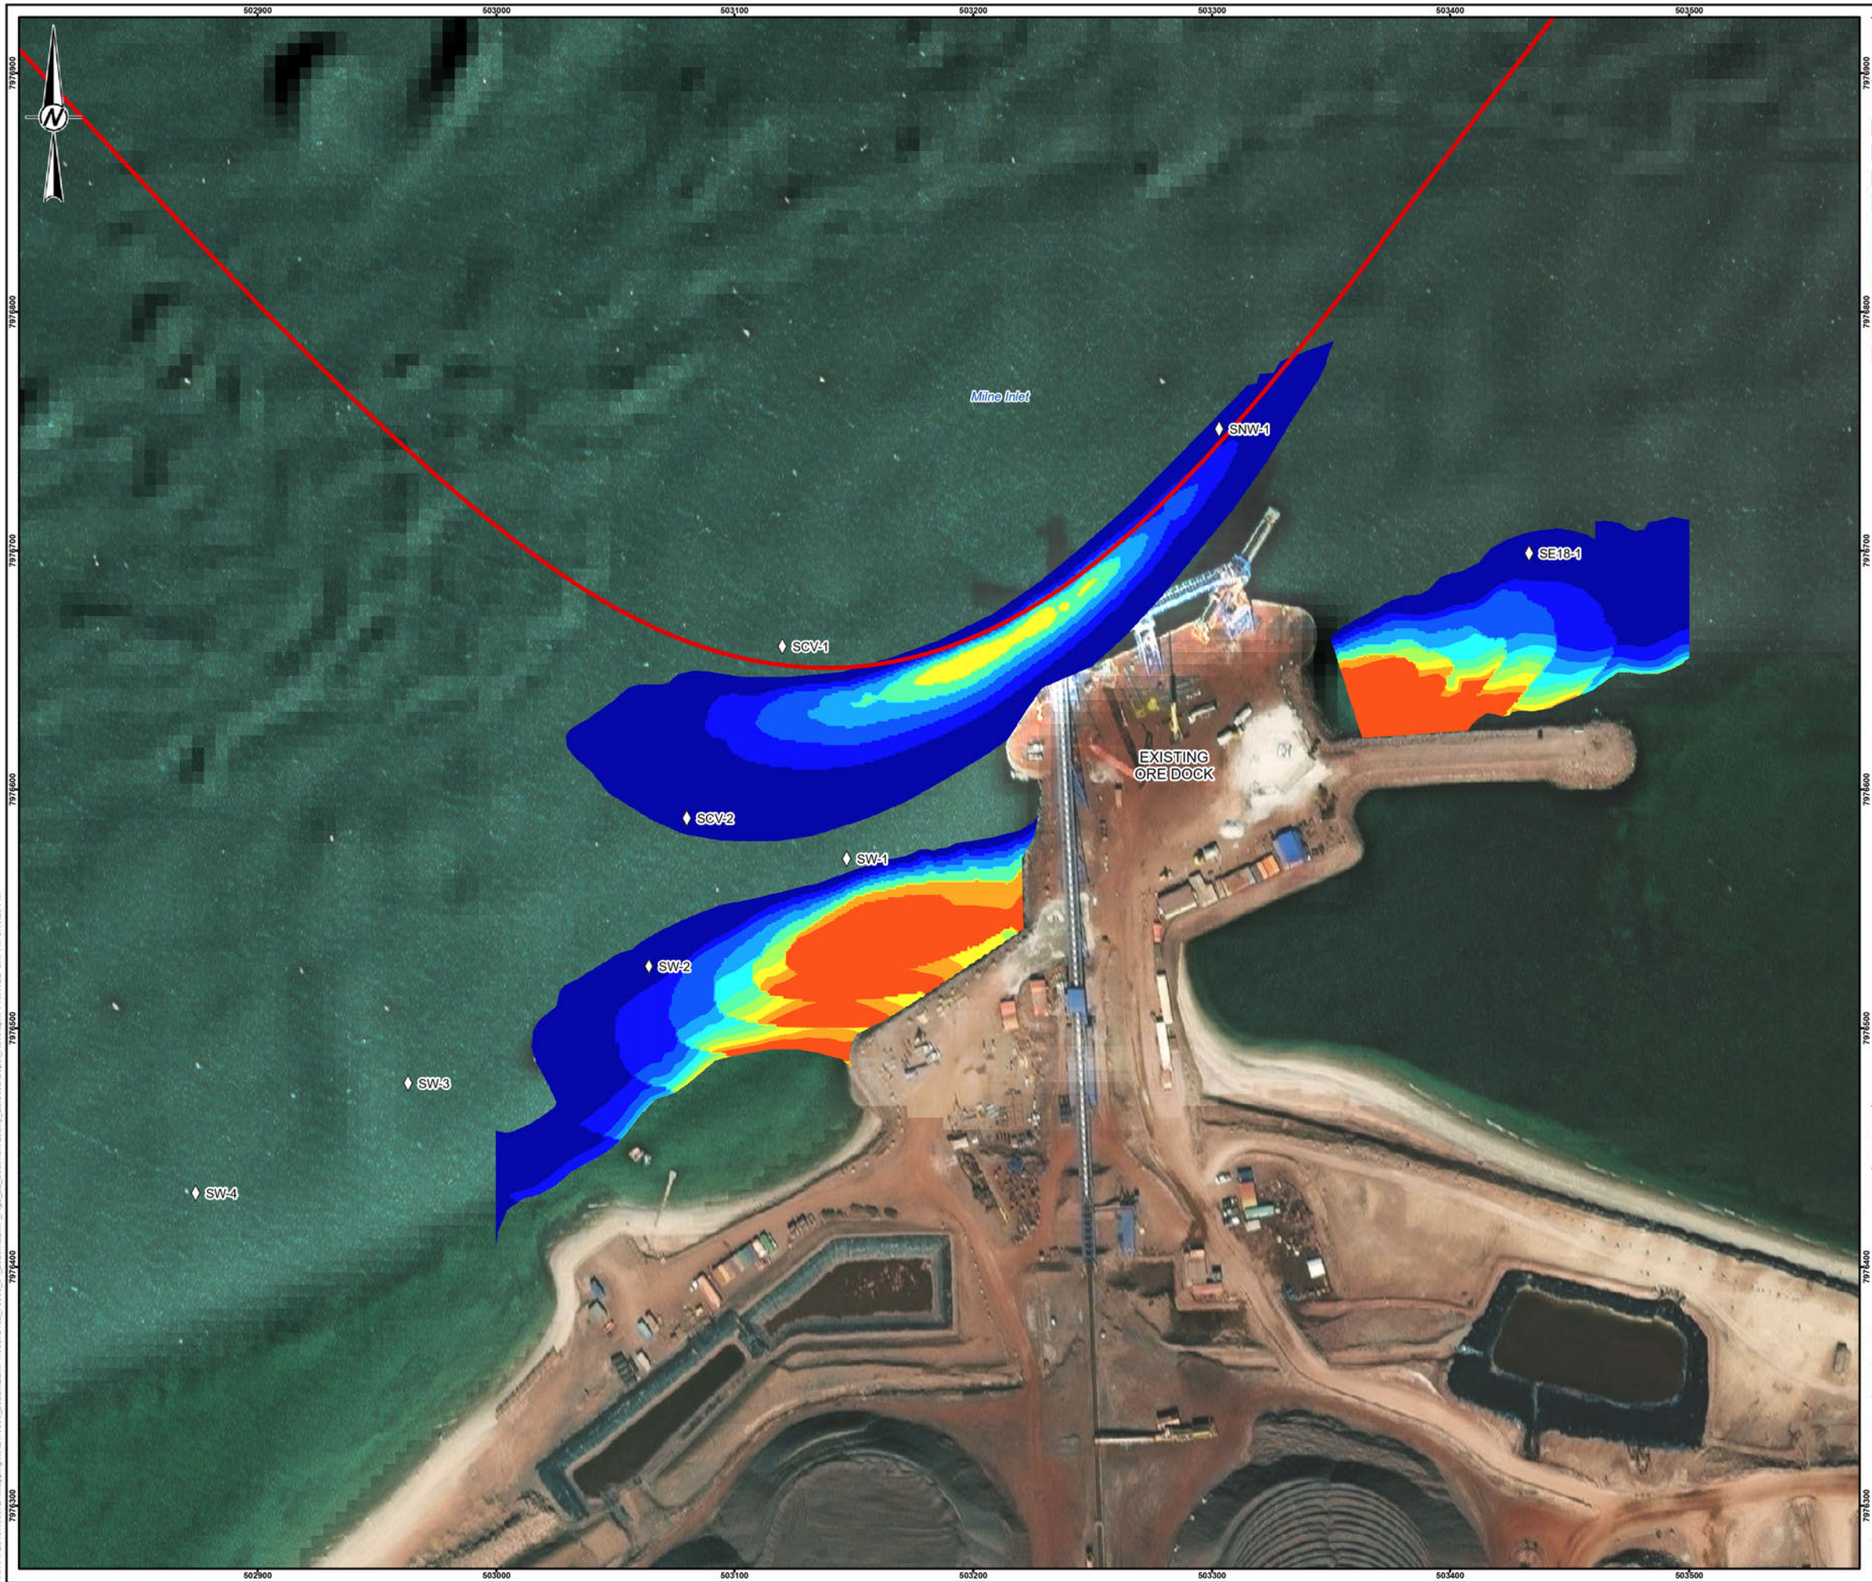
3.4.6.1.2 Metals

Sediment metal concentrations at the Capesize vessel stations sampled in 2023 were lower than applicable sediment quality guidelines, with the exception of arsenic at single station (SCV-1) which was marginally above the conservatively derived CCME ISQG and the NOAA T_{20} benchmark but was below the CCME PEL. While arsenic concentrations at SNW-1 and SW-4 were below the applicable screening criteria, arsenic concentrations were elevated compared to the other Capesize stations. The elevated concentration at these three stations were likely due to their higher proportion of fines. Exceedance of generic CCME ISQGs for sediment metals in Northern Canada is not uncommon under naturally occurring background conditions, as evident under baseline conditions in Milne Inlet, where arsenic concentrations up to 9.0 mg/kg were measured in sediments collected during the baseline sampling programs.

Therefore, the low magnitude exceedance of the conservatively derived ISQG in the one Capesize vessel station (SCV-1) is likely reflective of background conditions and related to physical sediment properties (i.e., percent fines due to natural coastal sorting processes) and may only be due to the influence of Port activities.

3.4.6.1.3 BTEX and VOCs



Sediment BTEX, petroleum hydrocarbons, and PAHs were not detected in sediments from the eight stations (Appendix 3D).

3.4.6.1.4 Capesize Vessel Scour Predictions

In 2023, the NIRB and Federal Ministers approved the continued transportation and shipping of 6 million tonnes per annum (Mtpa) of iron ore via the Tote Road and Northern Shipping Route from Milne Port during the ice-free period between 1 July and 31 October. As part of the approval, it was understood that vessel traffic would remain the same as that experienced since 2018 (maximum of 84 ore carriers), and that the introduction of larger vessels (Capesize) may further offset overall ship traffic requirements. To assess potential effects of the Sustaining Operations Proposal (SOP) on the marine environment, WSP conducted a Ship Wake and Propeller Wash Assessment to address possible project effects on the marine physical environment related to shipping activities associated with increased large vessel traffic (WSP 2023).

To develop a baseline condition of the sediment located at the Ore Dock area, eight sediment sampling stations were established to monitor Capesize vessel effects over time (Section 3.2.3). Figure 3-22 shows the location of the eight Capesize vessel sediment sampling stations in relation to maps of predicted scour depth for Capesize vessel operations. Results of the WSP (2023) show that scour was predicted to occur over most of the berthing area for Capesize vessels with localized scour predicted to exceed 0.5 m in depth due to the tug propeller jets on the starboard side of vessels. Scour from the tugs is expected when their propeller is facing the shoreline. Predicted scour effects are greatest in the vicinity of Capesize vessel sediment stations SW-1, SW-2, and SE18-1 (Figure 3-22). As shown in Figure 3-22, most of the Capesize vessel sediment stations are located outside of the maximum predicted scour depths as these stations were established along the 15 m depth contour. The 15 m depth contour is considered to be unaffected by winter ice scour and has been associated with relatively higher species counts and increased species diversity for both marine flora and fauna (SEM 2015).

The effects assessment estimated that propeller-generated wash velocities have the potential to cause scour and turbidity in the berthing area for all vessels, including the Supramax to Capesize. In 2023, Baffinland committed that stations SW-1 through SW-4, SE18-1, SNW-1, and two new sites (SCV-1 and SCV-2) would be monitored for scouring effects on sediment and benthic infauna for three years after the initial use of large (Baby Cape and Capesize) ore carriers. Following this three-year period, Baffinland will consider a reduced frequency in sampling at these locations (once every three years) if sediment and benthic conditions at these sites are shown to be stable and within the limits of impact predictions.

3.4.7 QA/QC Results

The 2023 sediment quality data were considered valid based on the results of the QA/QC assessment provided in Appendix 3E. Briefly,

- The Relative Percent Difference (RPD) was below the Data Quality Objective (DQO) of 50% in all parent/duplicate pairs except for SNE-13 and DUP-C for gravel (RPD = 131%); however, particle size in sediment is inherently variable and is therefore not unexpected. The QA/QC results suggest there was low variability and high precision between duplicates consistent with sediment quality (Table 1, Appendix 3E).
- Chemical analyses on all sediment samples were completed within the sample hold time requirements (Table 2, Appendix 3E).
- Data reported by the laboratory were considered reliable according to the accredited laboratory QA/QC assessment.

Overall, the QA/QC results indicate that the sediment quality data collected during the 2023 sampling program are of acceptable quality to address the objectives stated in Section 3.1.1.

3.4.8 TARP Assessment

Results of the sediment quality assessment above were screened against the TARP criteria (Table 3-2). The ‘Low Risk’ threshold was not triggered in 2023 because the sediment quality indicators present were at concentrations lower than the ISQG. Where isolated ISQG exceedances did occur, sediment concentrations were within expected background concentrations as informed by pre-project baseline studies. Spatial and temporal trend analysis of fines content and sediment iron concentrations did not suggest a pattern indicative of Port-related effects beyond FEIS predictions (Baffinland 2012, 2013).

3.5 Discussion

Over multiple monitoring years since 2014, the MEEMP has characterized sediment quality along both coastal and offshore transects radiating out from the Ore Dock area. Overall, monitoring results have remained within original FEIS predictions and subsequent addenda (Baffinland 2012, 2013). These predictions forecasted no significant residual effects on sediment quality but indicated the potential for minor localized sediment disturbance associated with propeller wash, which is expected to stabilize over time, as well as the potential for minor localized increases in nutrients, metal, or hydrocarbon concentrations. As discussed below, the 2023 MEEMP provided a characterization of sediment quality along two coastal and two offshore transects, as well as sampling of several stations close to the Ore Dock area to provide existing conditions sediment data prior to the use of larger ore carriers (Baby Cape and Capesize) at Milne Port. As found in other monitoring years when the radial design program was implemented, spatial relationships between sediment parameters in 2023 supported a more in-depth statistical analysis of the percent fines and sediment iron data to evaluate spatial patterns and temporal trends over time.

3.5.1 Percent Fines and Substrate Composition

In 2023, both offshore transects showed a pattern of increasing fines with distance from the Ore Dock area, but with higher fines content in sediments from stations located along the Northeast Transect compared to the Northwest Transect. This overall sediment distribution pattern occurs along a depth gradient and is reflective of natural sediment processes by which finer sediments accumulate in offshore deeper waters over time. Though in previous years the fines content along the two offshore transects were more comparable, closer to the Port along the shallower Coastal Transects, the sediment grain size was naturally more variable with both sand and fines present in differing proportions depending on the station location. This to be expected as nearshore sediments are more influenced by coastal processes and morphology, as well as inputs from rivers or streams. To assess the potential for scouring due to Port-activities and given the observed relationship between proportion of fines and sediment metals in Milne Inlet, statistical beta regression modelling analysis was undertaken to assess whether spatial and temporal changes in percent fines along the transects could be Project-related.

Along the West Transect closer to the Ore Dock area, sediment substrates at stations were variable but showed a significant decreasing trend in fines within the vicinity of the Ore Dock area, providing some indication that propeller-generated currents might be causing localized scouring and disturbance of the seabed. Propeller wash effects around the Ore Dock area in Milne Port are consistent with the predictions of the FEIS and subsequent addenda, which forecasted the potential for minor and localized sediment disturbance and overall negligible residual effects on sediment quality in Milne Port (Baffinland 2012, 2013). It is important to note, that regardless of potential propeller wash influence, these stations continued to support diverse benthic invertebrate communities, as discussed in Chapter 4. Sediments sampled further along the coastal West Transect at and close to the mouth of Phillips Creek, have consistently shown influence of the creek, in terms of increased sand content and decreased fines due to the influx of stream water and the downstream transport of sediments via the creek. Statistical analysis confirmed that this was also the case in 2023. As in previous years, the proportion of fines started to increase again further westward along the transect. Sediment grain size was less variable along the coastal Eastern Transect and the percentage of finer sediments along this transect was not significantly different in 2023 compared to baseline conditions (Baffinland 2013; SEM 2014; 2015).

Some variability along the offshore and coastal transects is expected and tends to reflect natural factors that influence sediment dynamics in this area such as waves, currents, coastal topography, ice scour, water depth, and freshwater inputs from Phillips Creek. However, close to the Ore Dock area on the West Transect, the results presented in this assessment (consistent with the 2021 and 2022 targeted studies) suggest the presence of propeller wash effects around the Ore Dock area. The observed effects are consistent with the predictions of the FEIS and subsequent addenda (Baffinland 2012, 2013). While the 2023 MEEMP found that spatial trends in the proportion of sediment fines continued to differ between the four monitored transects, more subtle temporal trends or a lack of trends were evident over time.

3.5.2 Sediment Quality and Iron

The results of the Principal Components Analysis (PCA) confirmed a strong positive relationship between metal sediment concentrations and the proportion of fines, consistent with baseline observations in Milne Inlet (Baffinland 2013; SEM 2014; 2015) and observations made in previous sampling years (2014 to 2020). Given that sediment metal concentrations tended to be higher in areas with finer sediments whose distribution largely followed natural patterns, the PCA did not suggest that sediment metal concentrations were accumulating at elevated levels close to the Ore Dock area relative to other locations sampled within Milne Port.

In 2023, concentrations of metals in sediments sampled along the four transects were below the applicable CCME guidelines (i.e., ISQGs and PELs; CCME 1999) and NOAA sediment benchmarks (Buchman 2008). The only exceptions were arsenic, copper, and nickel, where there were infrequent and minor exceedances of conservatively derived guidelines and benchmarks, as was also observed under baseline conditions (Baffinland 2013; SEM 2014; 2015). Marginal guideline exceedances in sediments from Northern environments is not uncommon, especially in mineralized areas where these exceedances can routinely be reported under naturally occurring background conditions. Arsenic, copper, and nickel are not associated with ore processing at Mary River (Baffinland 2012) and are not present in elevated concentrations close to the Ore Dock area, further supporting the likelihood that the observed concentrations reflect regional background concentrations. As found in previous MEEMP years, PAHs and hydrocarbons were not detected in sediments sampled from Milne Port in 2023, with the exception of a sample where detected concentrations of two hydrocarbons were either below applicable guidelines or were close to the detection limit.

Iron concentrations in Milne Inlet have been flagged by Inuit to be of concern due to the potential for increased deposition of iron ore in the form of dust or in runoff from storage stockpiles. Marine sediment guidelines for iron are not currently available and, as such, the sediment data for iron were also evaluated spatially and temporally along the transects using beta regression modelling. Spatially, iron behaved like the other metals and was strongly associated with finer sediments whose distribution followed natural sediment processes within Milne Inlet and was not significantly affected by the Project. Generally, where sediment distribution and metals concentrations along the Northern Offshore Transects were influenced by increasing water depth with distance from the Ore Dock area, the Coastal transects were influenced by the coastline topography and features, including Phillips Creek.

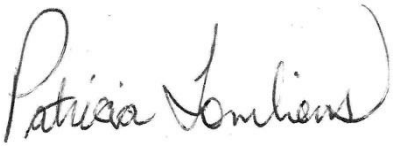
As observed for the fines content of the sediments, while the 2023 MEEMP found that spatial trends in the sediment iron continued to differ between the four monitored transects, more subtle temporal trends or a lack of trends were evident over time. Results found that in general the iron content of sediments sampled form Milne Inlet in 2023 was not significantly greater than that measured under baseline conditions, thus, indicating sediment iron concentrations have not increased over time in the Milne Inlet study area. Similar to other metals, iron was not present in elevated concentrations close to the Ore Dock area, and concentrations up to 250 m from the Ore Dock area were either stable or exhibited a decrease over time.

3.5.3 Sediment Sampling to Support Assessment of the Use of Capesize Vessels

Eight stations were sampled in 2023 as part of the Capesize vessel effects monitoring program to establish baseline conditions prior to the arrival of Baby Cape and Capesize ore carriers in Milne Inlet. Consistent with the Northern and Coastal Transect stations, the physical composition of sediments differed among stations, with both sand and fines present in differing proportions depending on the station location. Concentrations of metals at these stations were lower than applicable sediment quality guidelines, except for arsenic at station SCV-1 which was present at a concentration reflective of background conditions. Detectable concentrations of BTEX, PHCs and PAHs were not found at any of the Capesize vessel stations. Results for these stations appear to be consistent with overall MEEMP project stations.

3.6 Conclusion and Recommendations

The 2023 sediment sampling program and subsequent comprehensive data analysis indicate that the Project has not significantly impacted Milne Inlet sediment quality in 2023, or years previous. Evidence for this conclusion is validated from the continued measurement of key sediment parameters below applicable guidelines, and/ or are reflective of naturally occurring background conditions. Further, as was demonstrated through statistical analyses, distribution of fine sediment (which is strongly related to sediment metals) in Milne Inlet is largely not influenced by Project activities but, rather by natural coastal processes that differed between the Northern Offshore Transects and the Coastal Transects. The exception is the finding of likely localized scouring effects (associated with propeller wash) in the immediate vicinity of the Ore Dock area on the coastal West Transect, as predicted in the FEIS (Baffinland 2012, 2013). These effects are expected to stabilize over time. Importantly, associated impairment of the benthic community was only documented in 2020 at one station in this area, with performance indicators continuing to rebound in 2023.



As observed for the fines content of the sediments, while the 2023 MEEMP found that spatial trends in the sediment iron continued to differ between the four monitored transects, more subtle temporal trends or a lack of trends were evident over time. Analysis conducted for the assessment found that sediment iron concentrations have not increased over time in the Milne Inlet study area. Similar to other metals, iron was not present in elevated concentrations close to the Ore Dock area, and concentrations up to 250 m from the Ore Dock area were either stable or exhibited a decrease over time.

Sediment monitoring to date suggests that mitigation measures are functioning as intended and that Project activities are being managed in a way that has not adversely affected marine sediment within the Milne Inlet study area. Given that there will be continued use of larger ore carriers (Baby Cape and Capesize) at Milne Port, Baffinland has committed to a frequency of annual sampling of the newly implemented Capesize monitoring stations, for a minimum of three years (2023 to 2025) to identify Project-related effects due to the change in vessel types.

3.7 Closure

We trust this information is sufficient for your needs at this time. Should you have any questions or concerns, please do not hesitate to contact Phil Rouget, on behalf of the undersigned, at +1 250 419 4945.

SEDIMENT SAMPLING LOG

Project No: 1663724[redacted]-70000 (02)
Project Title: Baffinland MEEMP [redacted] 2023
Date: 19 Aug 23
Inspected by: TT
Station Number (ID): SCV-1
Sampling Method: VV
Weather: Light rain, 8-10 kts SE, 4-6°C
Lat/Longitude: on WP
Sampling Depth: 35.8 m
# of Attempts to Obtain Sample: 1
Time of Collection: 13:35 / 14:20 - sample collin

Sediment Description (including colour, type/grain size, anthropogenic debris, organic material, shell, wood, odour, HC sheen, staining, organisms/biota etc.):

Grab - jaws closed, overlying water, surface intact
0.5 cm sandy silt brown overtop of a grey sand and silt layer
SILT and SAND, moist, soft, brown, 60% fines, 40% f-c sand poorly graded, low plasticity, contains trace gravel (subrounded, subangular), Pectinaria, Macoma, trace shell debris, no odour and no sheen noted

Approx % collected in grab sample 15-20% (5.5cm) %

Photograph Notes (grab, sampling location, field sampling methods, public use, etc):

APPENDIX 3C

Sediment Quality Laboratory Data

CERTIFICATE OF ANALYSIS

Work Order	: **VA23B8536**	Page	: 1 of 16
Amendment	: **1**		
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372402/70000/03	Date Samples Received	: 11-Aug-2023 11:00
PO	: 166372402/70000/03	Date Analysis Commenced	: 15-Aug-2023
C-O-C number	: ----	Issue Date	: 18-Jan-2024 13:14
Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amended COA(1): Additional VOC data is included for VA23B8536 - 6, 7 & 8.

Qualifiers

Qualifier	*Description*
DLHM	*Detection Limit Adjusted: Sample has high moisture content.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23B8536**	Page	: 1 of 20
Amendment	: **1**		
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372402/70000/03	Date Samples Received	: 11-Aug-2023 11:00
PO	: 166372402/70000/03	Issue Date	: 18-Jan-2024 13:13
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Vancouver	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Total Carbon by Combustion	E351 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 ALS Environmental - Vancouver	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Soil/Solid	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601.SG ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Sample extracts are subjected to in-situ silica gel treatment prior to analysis by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
VOCs (BC List) by Headspace GC-MS	E611C ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hex:Ace GC-MS (Low Level CCME)	E641A-L ALS Environmental - Vancouver	Soil/Solid	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are extracted with hexane/acetone and analyzed by GC-MS. If reported, IACR (index of additive cancer risk, unitless) and B(a)P toxic potency equivalent (in soil concentration units) are calculated as per CCME PAH Soil Quality Guidelines fact sheet (2010) or ABT1.
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil	EC356 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
F1-BTEX	EC580 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Vancouver	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Digestion for Metals and Mercury	EP440 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl. This method is intended to liberate metals that may be environmentally available.
VOCs Methanol Extraction for Headspace Analysis	EP581 ALS Environmental - Vancouver	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	EP601 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix:

No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Brieanna Allen	Production/Validation Manager	Organics, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Sask Soils, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.
Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Accreditation

Accreditation	*Description*	*Laboratory*	*Address*
A	CALA ISO/IEC 17025:2017	SK ALS Environmental - Saskatoon	819 58 Street East, Saskatoon, SK
B	CALA ISO/IEC 17025:2017	VA ALS Environmental - Vancouver	8081 Lougheed Highway, Burnaby, BC

Applicable accreditations are indicated in the Method/Lab column as superscripts.

Workorder Comments

Amended COA(1): VOC data is included for VA23B8538-1 & 2.

Qualifiers

Qualifier	*Description*
DLHM	*Detection Limit Adjusted: Sample has high moisture content.*

PO	: 166372402/70000/03	Issue Date	: 18-Jan-2024 13:25
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Duplicate (DUP) RPDs								
Metals	Anonymous	Anonymous	Antimony	7440-36-0	E440	31.7 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.

Polycyclic Aromatic Hydrocarbons	Anonymous	Anonymous	Dibenz(a,h)anthracene	53-70-3	E641A-L	52.2 % DUP-H	50%	Duplicate RPD does not meet the DQO for this test.
Polycyclic Aromatic Hydrocarbons	Anonymous	Anonymous	Pyrene	129-00-0	E641A-L	60.2 % DUP-H	50%	Duplicate RPD does not meet the DQO for this test.

Result Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Vancouver	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Total Carbon by Combustion	E351 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 ALS Environmental - Vancouver	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Soil/Solid	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601.SG ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Sample extracts are subjected to in-situ silica gel treatment prior to analysis by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
VOCs (BC List) by Headspace GC-MS	E611C ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hex:Ace GC-MS (Low Level CCME)	E641A-L ALS Environmental - Vancouver	Soil/Solid	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are extracted with hexane/acetone and analyzed by GC-MS. If reported, IACR (index of additive cancer risk, unitless) and B(a)P toxic potency equivalent (in soil concentration units) are calculated as per CCME PAH Soil Quality Guidelines fact sheet (2010) or ABT1.
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil	EC356 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
F1-BTEX	EC580 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Vancouver	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Digestion for Metals and Mercury	EP440 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl. This method is intended to liberate metals that may be environmentally available.
VOCs Methanol Extraction for Headspace Analysis	EP581 ALS Environmental - Vancouver	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	EP601 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Qualifiers

Qualifier	Description
E	*Matrix Spike recovery outside ALS DQO due to heterogeneous analyte background in sample.*

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Turnaround Time (TAT) Requested
☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.
Additional fees may apply to rush requests on weekends, st...
Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm
For all tests with rush TATs requested, please contact your AM to confirm availability.

Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Laboratory Supervisor	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Sam Silveira	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances

LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLHM	*Detection Limit Adjusted: Sample has high moisture content.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23B9385**	Page	: 1 of 17
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372402/70000/03	Date Samples Received	: 18-Aug-2023 11:00
PO	: 166372402/70000/03	Issue Date	: 28-Aug-2023 10:03
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Duplicate (DUP) RPDs								
Metals	Anonymous	Anonymous	Antimony	7440-36-0	E440	42.9 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	Lead	7439-92-1	E440	78.6 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Polycyclic Aromatic Hydrocarbons	Anonymous	Anonymous	Pyrene	129-00-0	E641A-L	57.9 % DUP-H	50%	Duplicate RPD does not meet the DQO for this test.

Result Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Vancouver	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Total Carbon by Combustion	E351 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 ALS Environmental - Vancouver	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Soil/Solid	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601.SG ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Sample extracts are subjected to in-situ silica gel treatment prior to analysis by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hex:Ace GC-MS (Low Level CCME)	E641A-L ALS Environmental - Vancouver	Soil/Solid	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are extracted with hexane/acetone and analyzed by GC-MS. If reported, IACR (index of additive cancer risk, unitless) and B(a)P toxic potency equivalent (in soil concentration units) are calculated as per CCME PAH Soil Quality Guidelines fact sheet (2010) or ABT1.
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil	EC356 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
F1-BTEX	EC580 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Vancouver	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Metals and Mercury	EP440 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl. This method is intended to liberate metals that may be environmentally available.
VOCs Methanol Extraction for Headspace Analysis	EP581 ALS Environmental - Vancouver	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	EP601 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 20		
No. of samples analysed	: 20		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Sask Soils, Saskatoon, Saskatchewan
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Organics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	no units
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

All Samples: Methanol vials not received at laboratory, but requested BTEX on Chain of Custody. The requested analysis is put on hold.

Amended COA(1): VOC data is included for VA23C0015 - 1, 10 & 11.

Samples SNW-5 and SNE-5 : Low methanol volume found on submitted VOC soil sample (all available vials). Sub sample might be taken from the jars and data qualified. Samples SNW-4, SW-12,SNW-3,DUP-E-23 ,SNE-9- only 1 vial has correct methanol level, second vial can't be used for the analysis.

Sample Comments

Sample	Client Id	*Comment*
VA23C0015-014	SW-12	Sample(014 & 018) : Soil jar was submitted as VOC sample container. VOC results may be biased low, and do not meet federal (CCME) or provincial requirements (for BC, AB-Tier1, MB, ON, SK).

Qualifiers

Qualifier	*Description*

DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLHM	*Detection Limit Adjusted: Sample has high moisture content.*
DLIS	*Detection Limit Adjusted due to insufficient sample.*
FR4	*As per applicable reference method(s), soil:water ratio for Fixed Ratio Leach was modified to 1:4 due to high soil organic content.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA23C0015**	Page	: 1 of 31
Amendment	: 1		
Client	: **WSP Canada Inc.**	Laboratory	: ALS Environmental - Vancouver
Contact	: Elaine Irving	Account Manager	: Amber Springer
Address	: 840 Howe St, 10th Floor Vancouver BC Canada V6Z 2S9	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: 166372302/700000/03	Date Samples Received	: 26-Aug-2023 13:40
PO	: ----	Issue Date	: 18-Jan-2024 12:26
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: VA22-GOLD100-028		
No. of samples received	: 20		
No. of samples analysed	: 20		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Metals	QC-MRG2-1109243 002	----	Antimony	7440-36-0	E440	123 % MES	80.0-120%	Recovery greater than upper control limit
Metals	QC-MRG2-1109243 002	----	Strontium	7440-24-6	E440	123 % MES	80.0-120%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	*Description*
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 ALS Environmental - Vancouver	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Moisture Content by Gravimetry	E144 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Total Carbon by Combustion	E351 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 ALS Environmental - Vancouver	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. This method does not adequately recover elemental sulfur, and is unsuitable for assessment of elemental sulfur standards or guidelines. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl, followed by CVAAS analysis.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
VH and F1 by Headspace GC-FID	E581.VH+F1 ALS Environmental - Vancouver	Soil/Solid	BC MOE Lab Manual / CCME PHC in Soil - Tier 1 (mod)	Volatile Hydrocarbons (VH and F1) is analyzed by static headspace GC-FID. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law. Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
CCME PHCs - F2-F4 by GC-FID	E601.SG ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	Sample extracts are subjected to in-situ silica gel treatment prior to analysis by GC-FID for CCME hydrocarbon fractions (F2-F4). Analytical methods for CCME Petroleum Hydrocarbons (PHCs) are validated to comply fully with the Reference Method for the Canada-Wide Standard for PHC. Test results are expressed on a dry weight basis. Unless qualified, all required quality control criteria of the CCME PHC method have been met, including response factor and linearity requirements.
BTEX by Headspace GC-MS	E611A ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
VOCs (BC List) by Headspace GC-MS	E611C ALS Environmental - Vancouver	Soil/Solid	EPA 8260D (mod)	Volatile Organic Compounds (VOCs) are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PAHs by Hex:Ace GC-MS (Low Level CCME)	E641A-L ALS Environmental - Vancouver	Soil/Solid	EPA 8270E (mod)	Polycyclic Aromatic Hydrocarbons (PAHs) are extracted with hexane/acetone and analyzed by GC-MS. If reported, IACR (index of additive cancer risk, unitless) and B(a)P toxic potency equivalent (in soil concentration units) are calculated as per CCME PAH Soil Quality Guidelines fact sheet (2010) or ABT1.
Particle Size Analysis (Pipette) - MMER Classification	EC184E ALS Environmental - Saskatoon	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.
Total Organic Carbon (Calculated) in soil	EC356 ALS Environmental - Saskatoon	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).
F1-BTEX	EC580 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1	F1-BTEX is calculated as follows: F1-BTEX = F1 (C6-C10) minus benzene, toluene, ethylbenzene and xylenes (BTEX).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH/EC	EP108 ALS Environmental - Vancouver	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Digestion for Metals and Mercury	EP440 ALS Environmental - Vancouver	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl. This method is intended to liberate metals that may be environmentally available.
VOCs Methanol Extraction for Headspace Analysis	EP581 ALS Environmental - Vancouver	Soil/Solid	EPA 5035A (mod)	VOCs in samples are extracted with methanol. Extracts are then prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law.
PHCs and PAHs Hexane-Acetone Tumbler Extraction	EP601 ALS Environmental - Vancouver	Soil/Solid	CCME PHC in Soil - Tier 1 (mod)	Samples are subsampled and Petroleum Hydrocarbons (PHC) and PAHs are extracted with 1:1 hexane:acetone using a rotary extractor.
Dry and Grind in Soil/Solid <60°C	EPP442 ALS Environmental - Saskatoon	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

					Laboratory Control Sample (LCS) Report				
					Spike	Recovery (%)	Recovery Limits (%)		
Analyte	CAS Number	Method	LOR	Unit	Concentration	LCS	Low	High	Qualifier

Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

					Matrix Spike (MS) Report					
					Spike		Recovery (%)	Recovery Limits (%)
